

# Beam dynamics simulations for the European XFEL photo injector

Cathode laser pulse shape influence

Mikhail Krasilnikov  
3D Ellipsoid Project Meeting  
Nizhny Novgorod, September 24, 2013

# “Nominal” XFEL Photo Injector (PI) setup for BD simulations

- RF gun:
  - Gun-4.1 field profile (FB=1.08) and Ecath=60.58MV/m\*
  - Main solenoid centered at z=0.276m, bucking at compensation
- Cathode laser:
  - Temporal: flat-top 2ps/21.5ps\2ps\*
  - Transverse: radial homogeneous
- Booster: ACC1=8xTESLA cavities:
  - 1<sup>st</sup> cavity is centered at z~4.04m from the cathode  
(1<sup>st</sup> iris of the 1<sup>st</sup> TESLA cavity → z=3.637m ↔ CDS at PITZ z=3.24m)
  - Epeak=33.5MV/m
  - Phase → on-crest
- ASTRA optimization
  - 200k particles
  - Minimized transverse projected transverse emittance at z=15m
  - Tuned parameters: laser rms spot size, main solenoid peak field, gun launch phase, rms bunch length\*\*

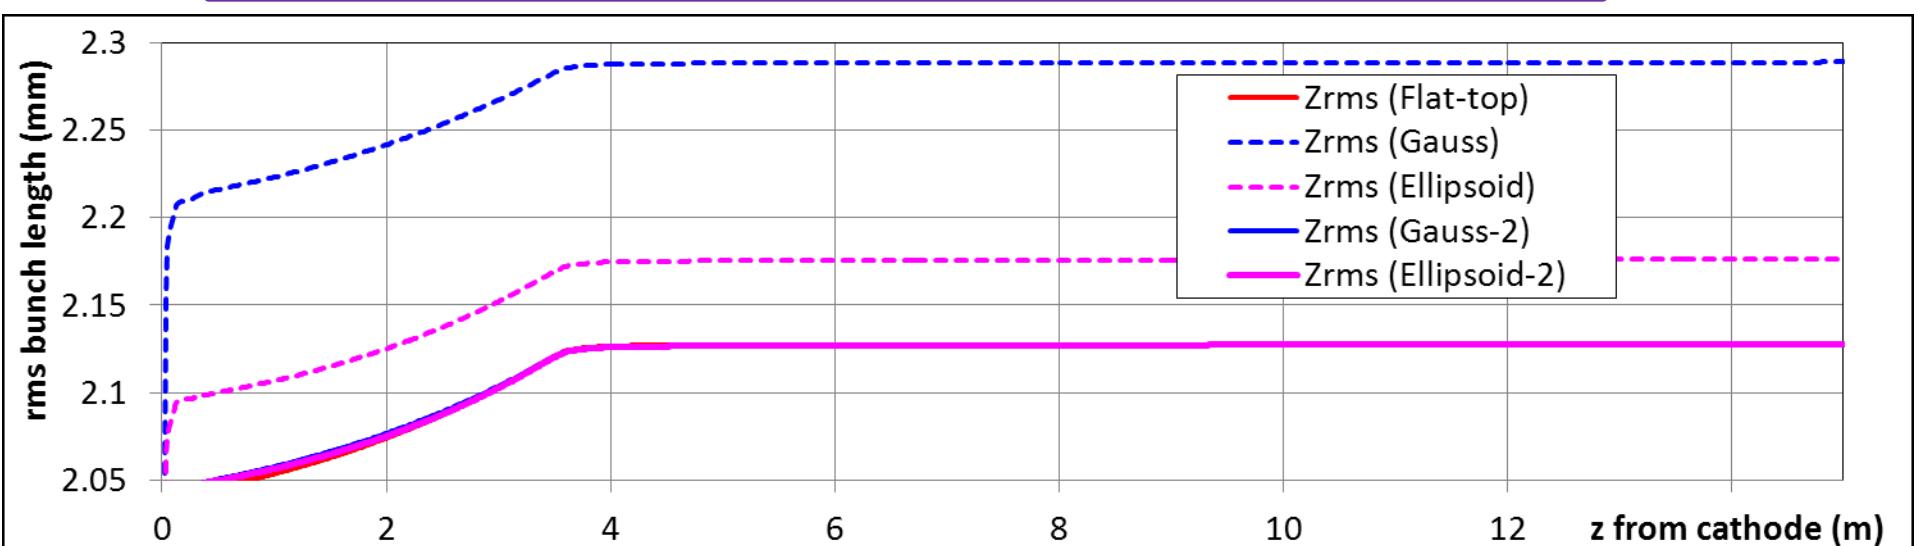

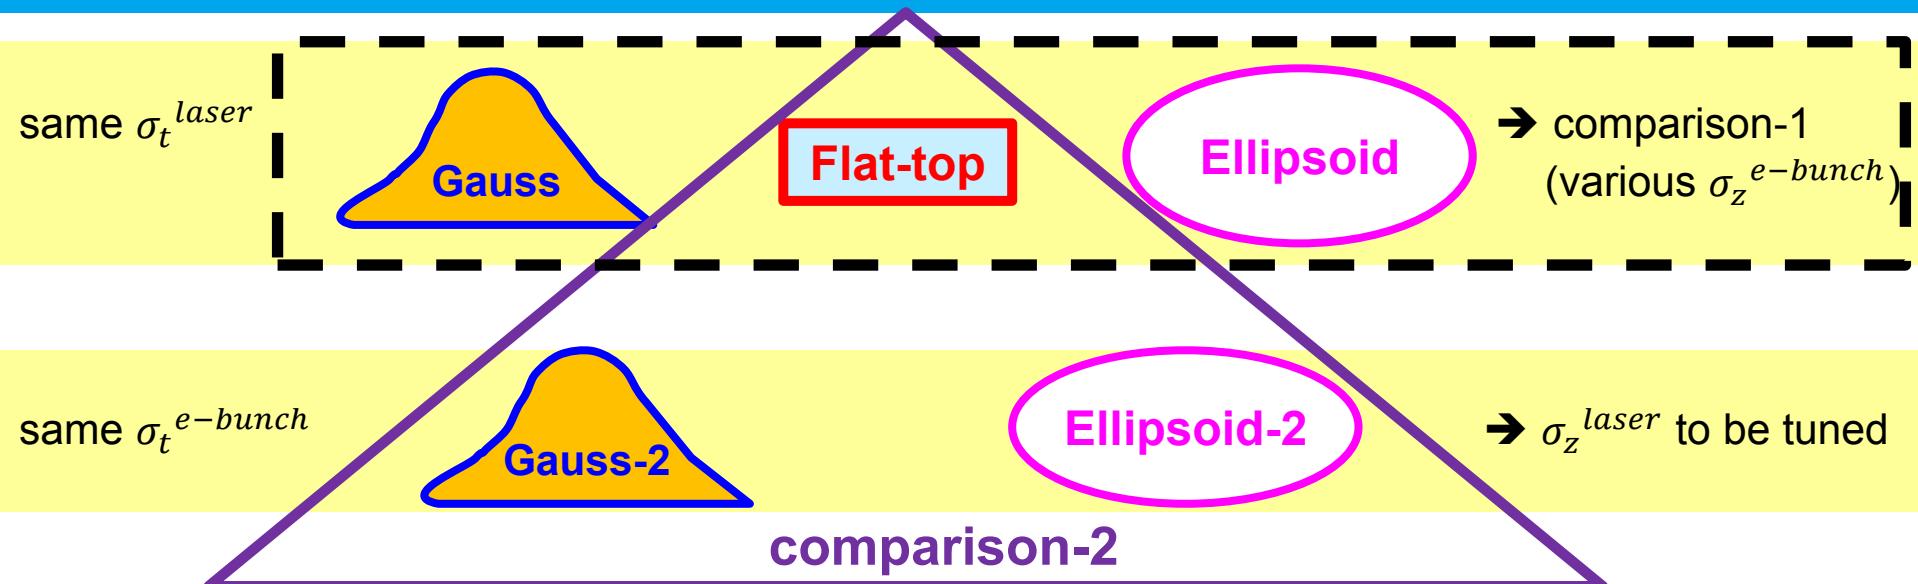

To be compared with Gaussian temporal profile and 3D ellipsoidal pulses

\* M. Krasilnikov, et al., Phys. Rev. ST Accel. Beams 15, 100701 (2012).

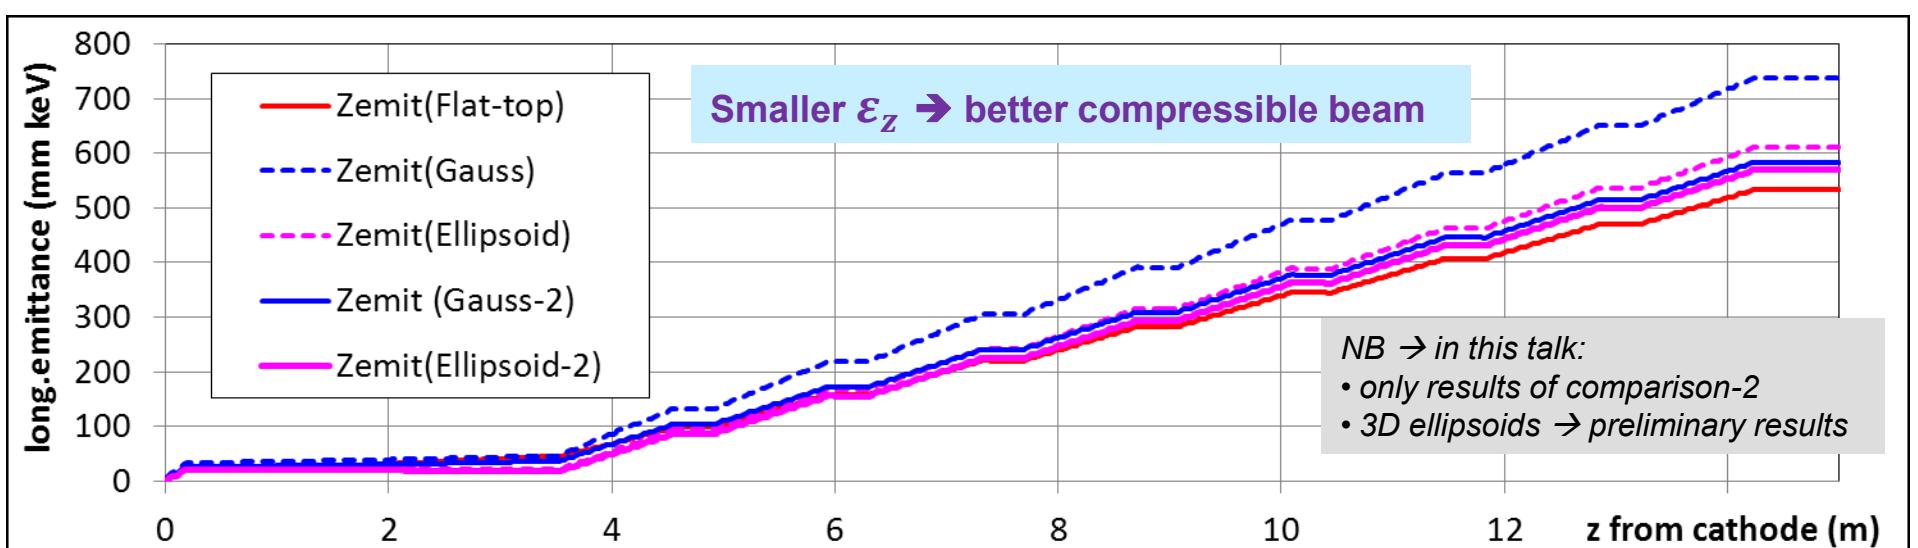

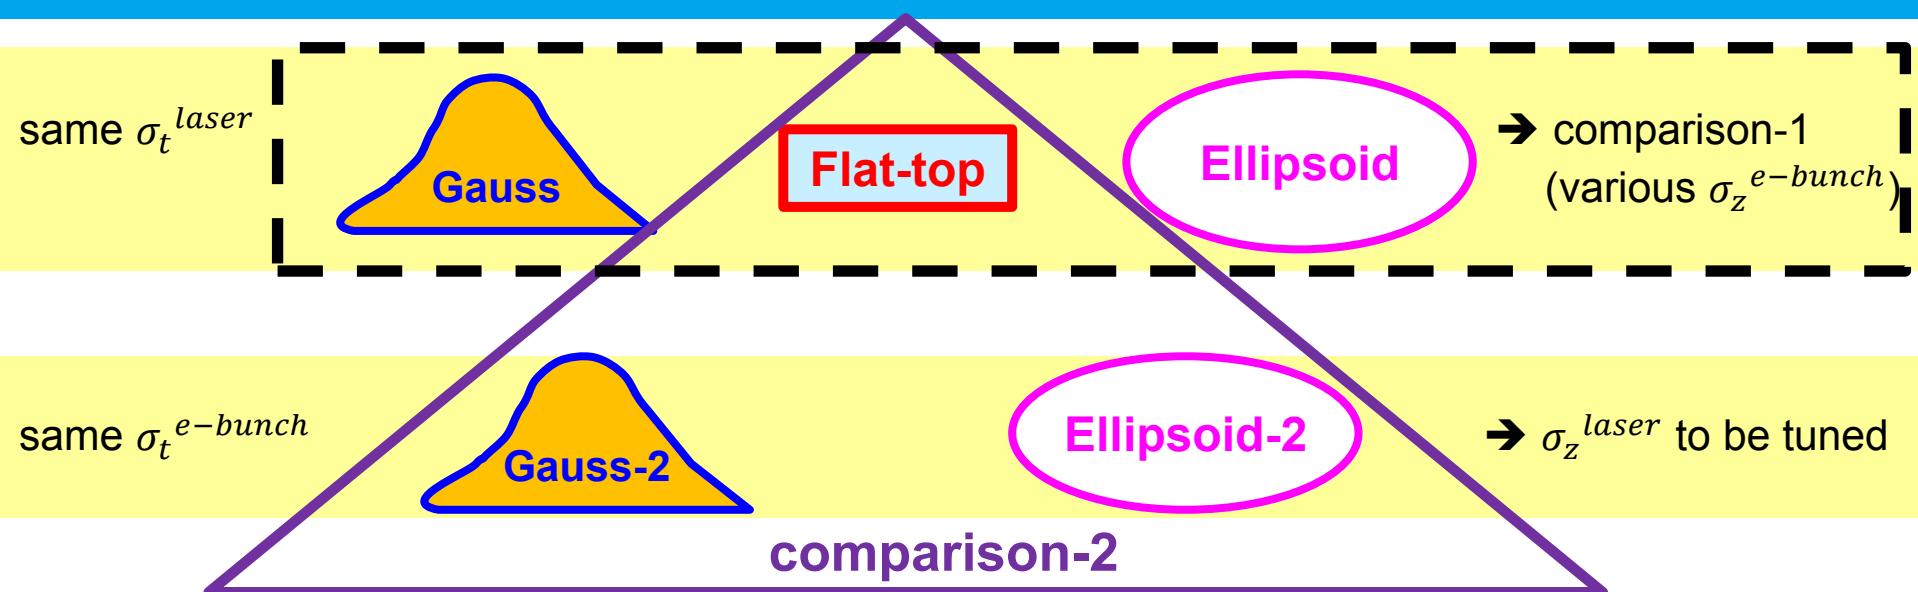

\*\* used for the Gaussian and 3D ellipsoid laser pulse optimization for the second comparison option

# $\epsilon_{projected}$ along the beam line and $\epsilon_{slice}(z = 15m)$

# Conclusions

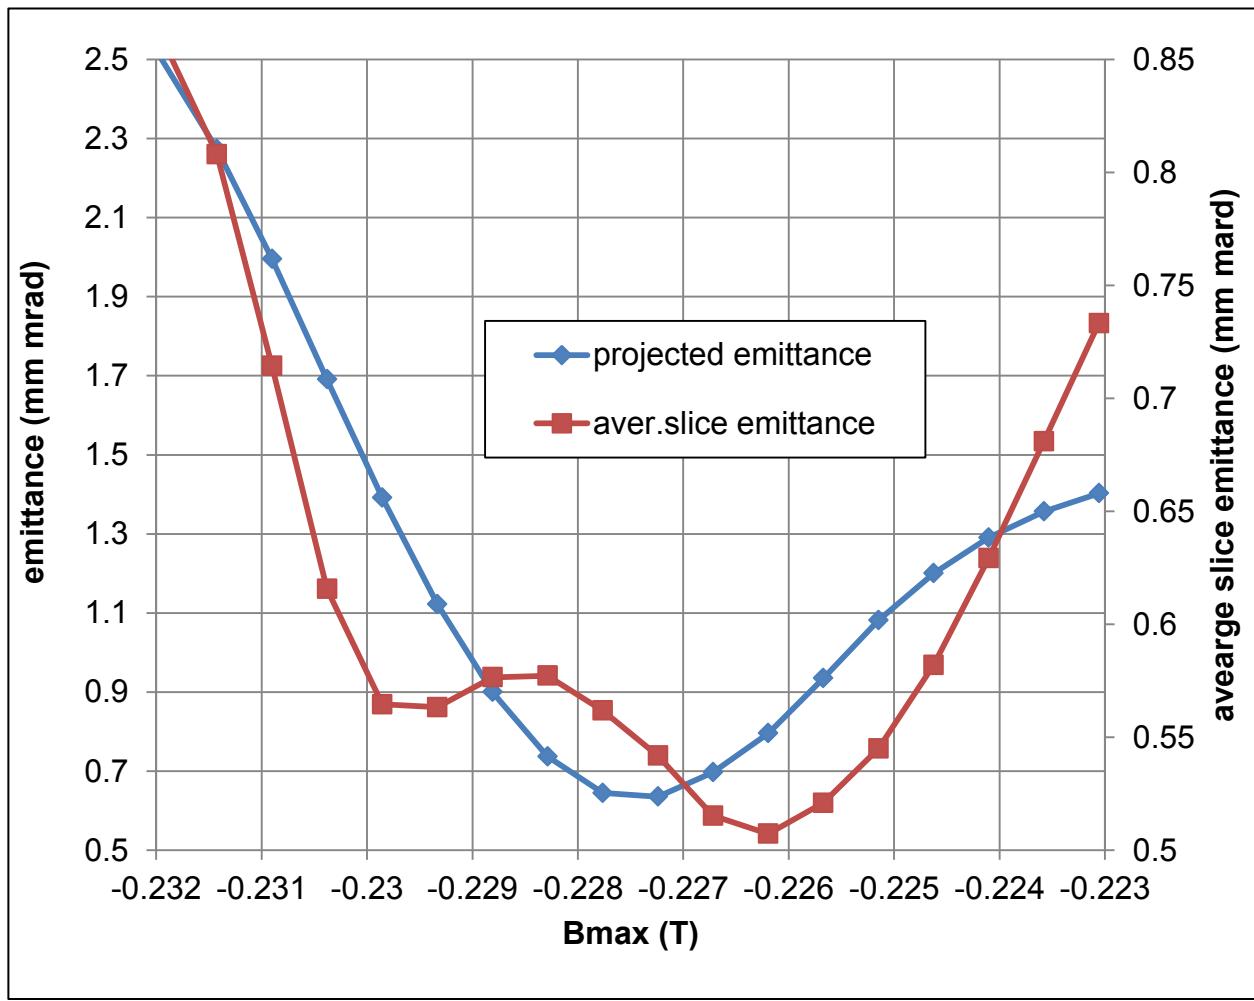

- Beam dynamics simulations for the European XFEL photo injector have been performed:
  - Gun and laser input → from PITZ-1.8 experimental data, comparing the PITZ-1.8 setup ( $E_{cath}=60.6\text{MV/m}$ )
  - ACC1 as a booster + further acceleration ( $\sim 150\text{MeV}$ )
  - Solenoid and booster positions were not varied
- 3 cathode laser pulse shapes were simulated to reach the smallest projected emittance after the injector:
  - Flat-top (2/21.5/2ps), Gaussian and 3D ellipsoid (preliminary)
  - Comparison-2 option discussed → tuning Gaussian and ellipsoid laser duration to yield the same rms electron bunch length
