

Simulation of booster BBA at PITZ

Progress summary and project outlook

Peetermans Karel
Zeuthen, 16/8/2022
Supervisor: Xiangkun Li

Project goals and concept of the script

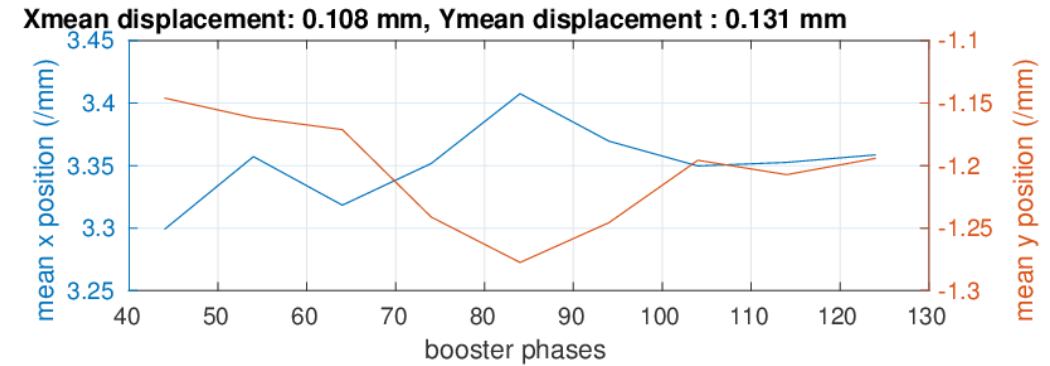

04/06/2022 P. Boonpornprasert, G. Adhikari

Idea:

- Beam on-axis (on average) for optimal emittance
 - Tune steerers for perfect booster entry
 - This is characterised by a flat booster phase-dependance (this will be our observable)
- Make situation more realistic by implementing earth mag. field and possibly other constant fields
- Better understanding of booster BBA

Method:

- Beam optics for trajectory through steerers
- Astra simulation for booster

Overview of talk

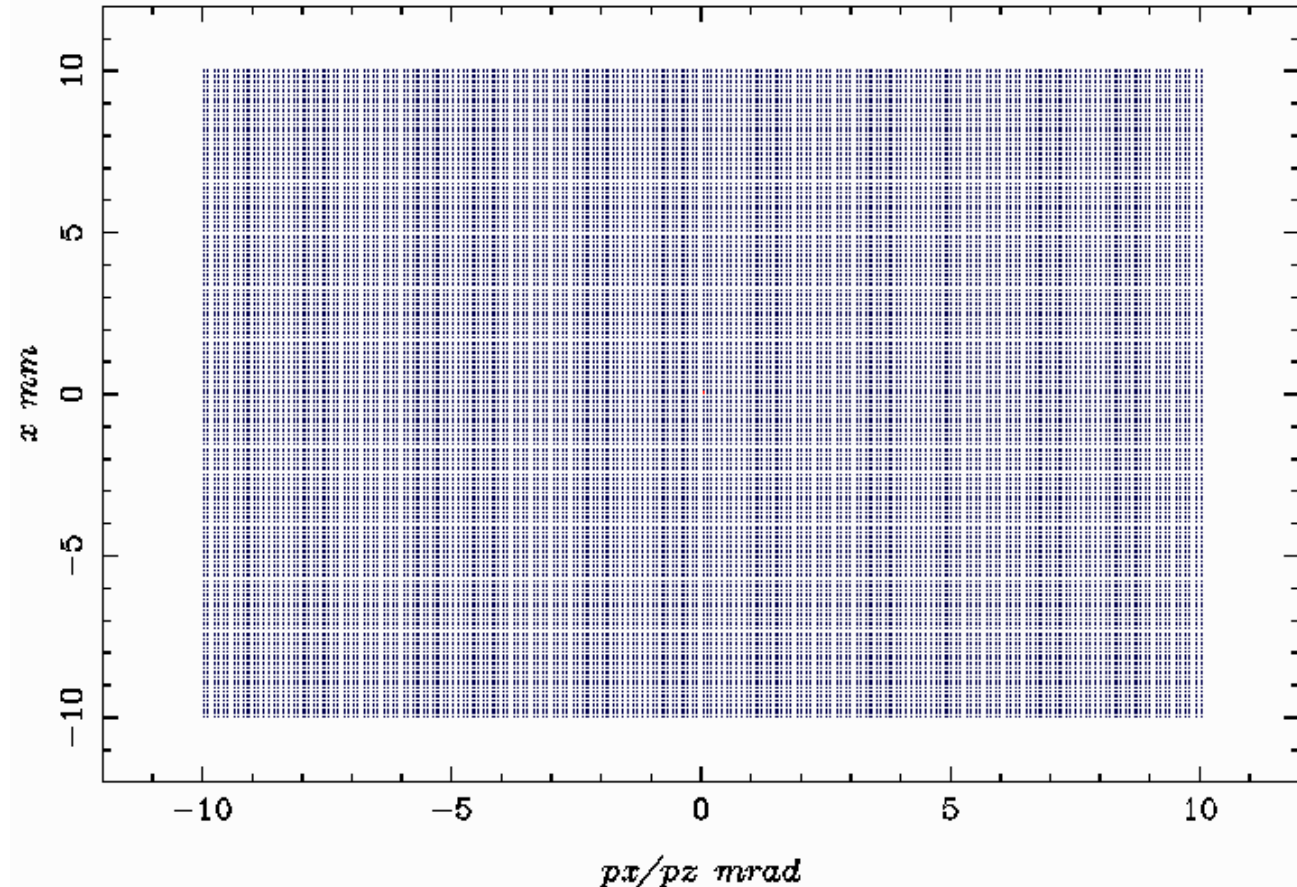

- Astra parameter scan and peak-to-peak goal function
- Backward tracking and calculating steering corrections
- Booster BBA measurements June and August 2022
- Current problems and outlook rest of project

Astra parameter scan and fitting measurement to simulation

Parameter scan

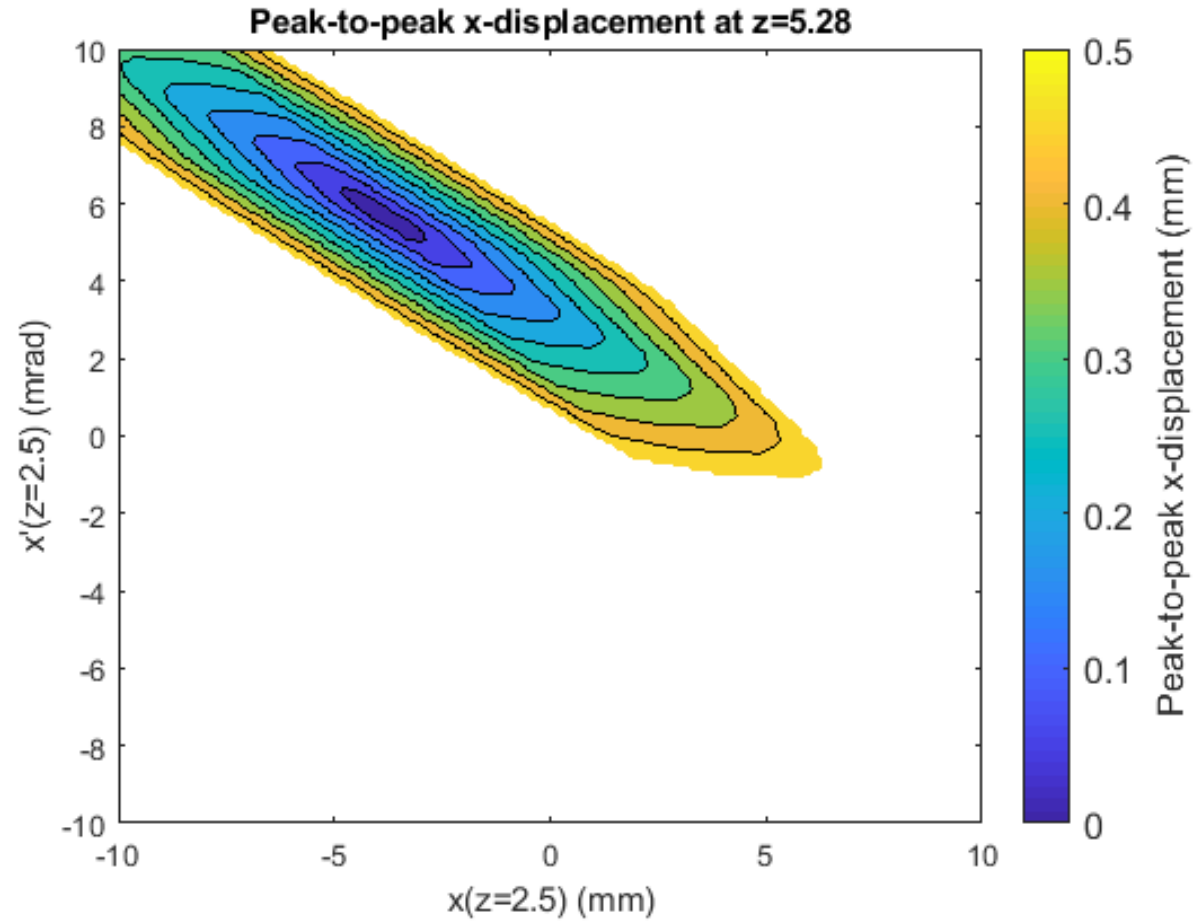

Idea:

- Simulate sending macro-particles which cover full x - x' phase space through booster
- Simulate where each particle ends up, no space charge
- x_c and x'_c are the bunch center and angle; in the simulation, each particle or electron represents a bunch with a given x_c and x'_c
- Fit measured curve (x_c at EMSY1 vs booster phase) to simulated curve to know where the electron must have started
- Goal-function fit: R-sq. difference of measurement and simulated data point

Parameter scan

Peak-to-peak displacement after adding $B=(0,-50,0)$ uT, $P=6.3$ MeV/c

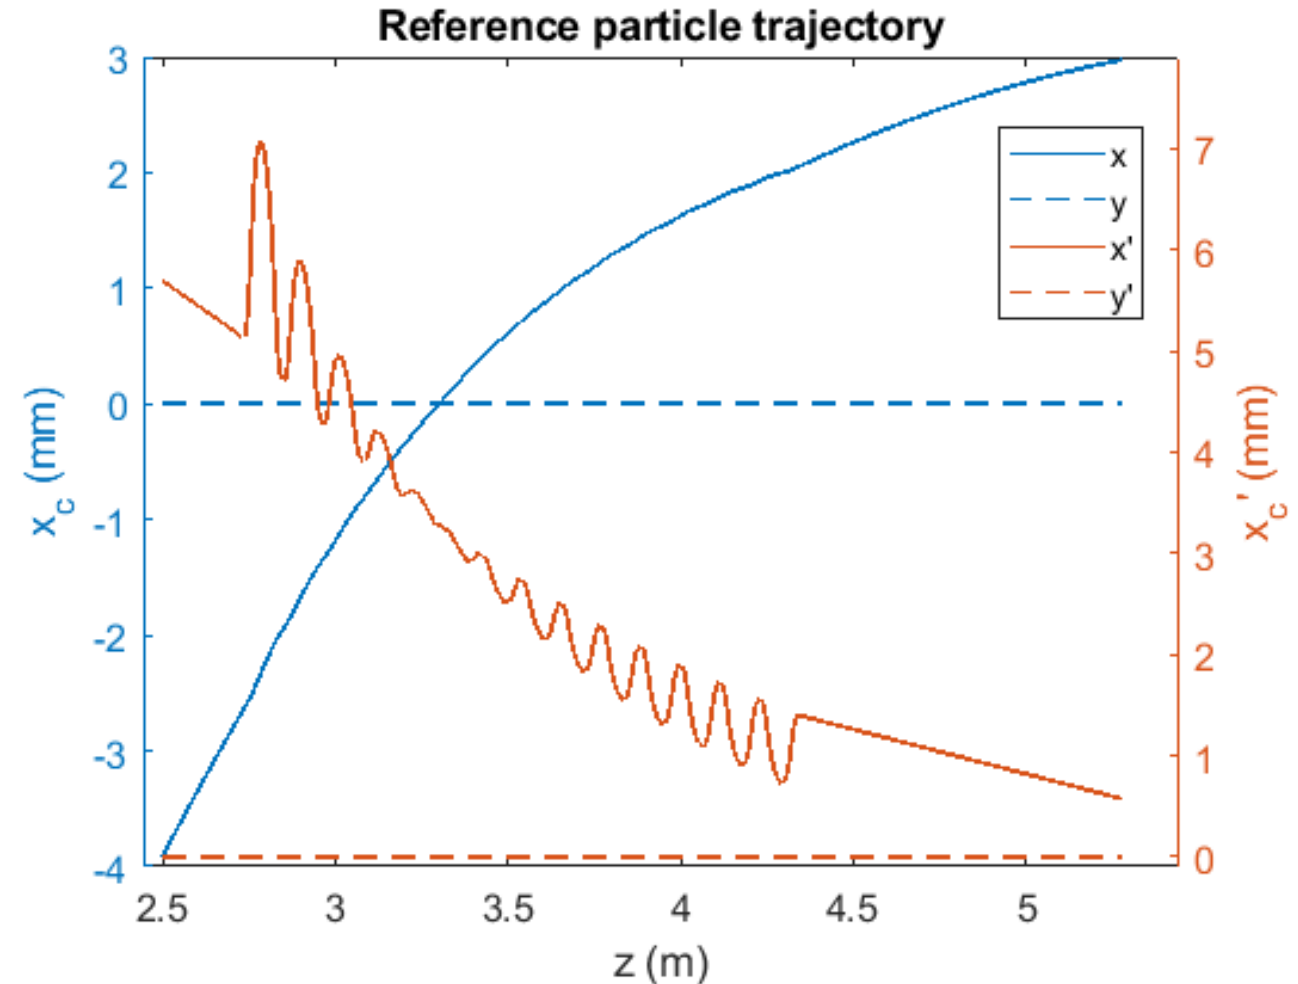

Parameter scan

Peak-to-peak displacement after adding $B=(0,-50,0)$ uT, $P=6.3$ MeV/c

For minimal x-displacement:

- Aim for particle to have positive angle to counteract effect of EMF
- Start with negative position so particle ends up around zero

Fitting measurement to simulation

Example of fitting measured curve (here measurement=simulation+noise)

Measured and best-fit x vs. ϕ

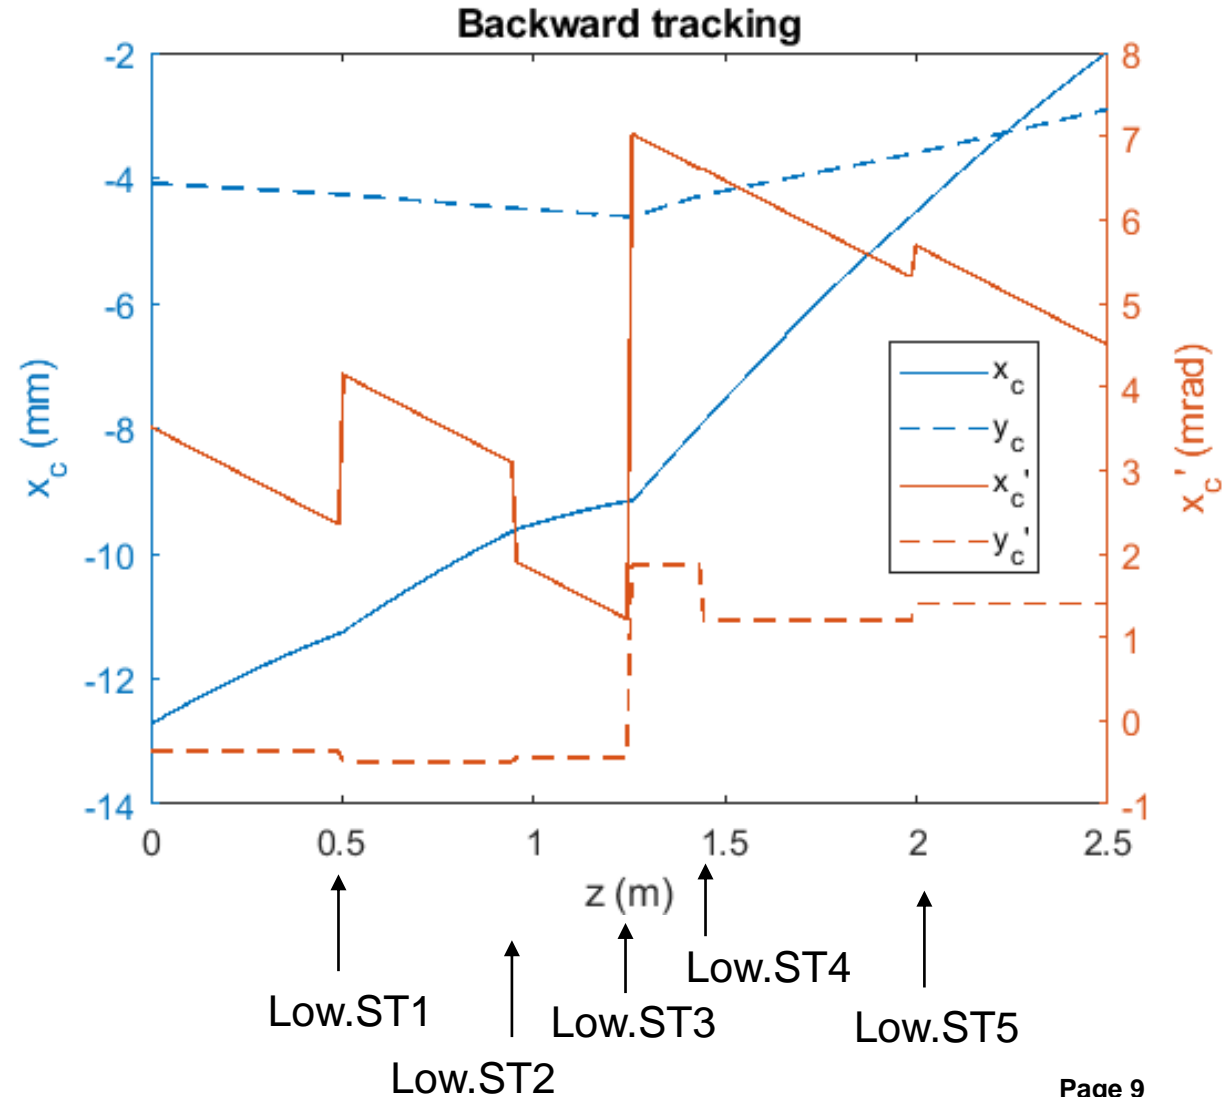

Goal function in phase-space, x

Steering

Idea:

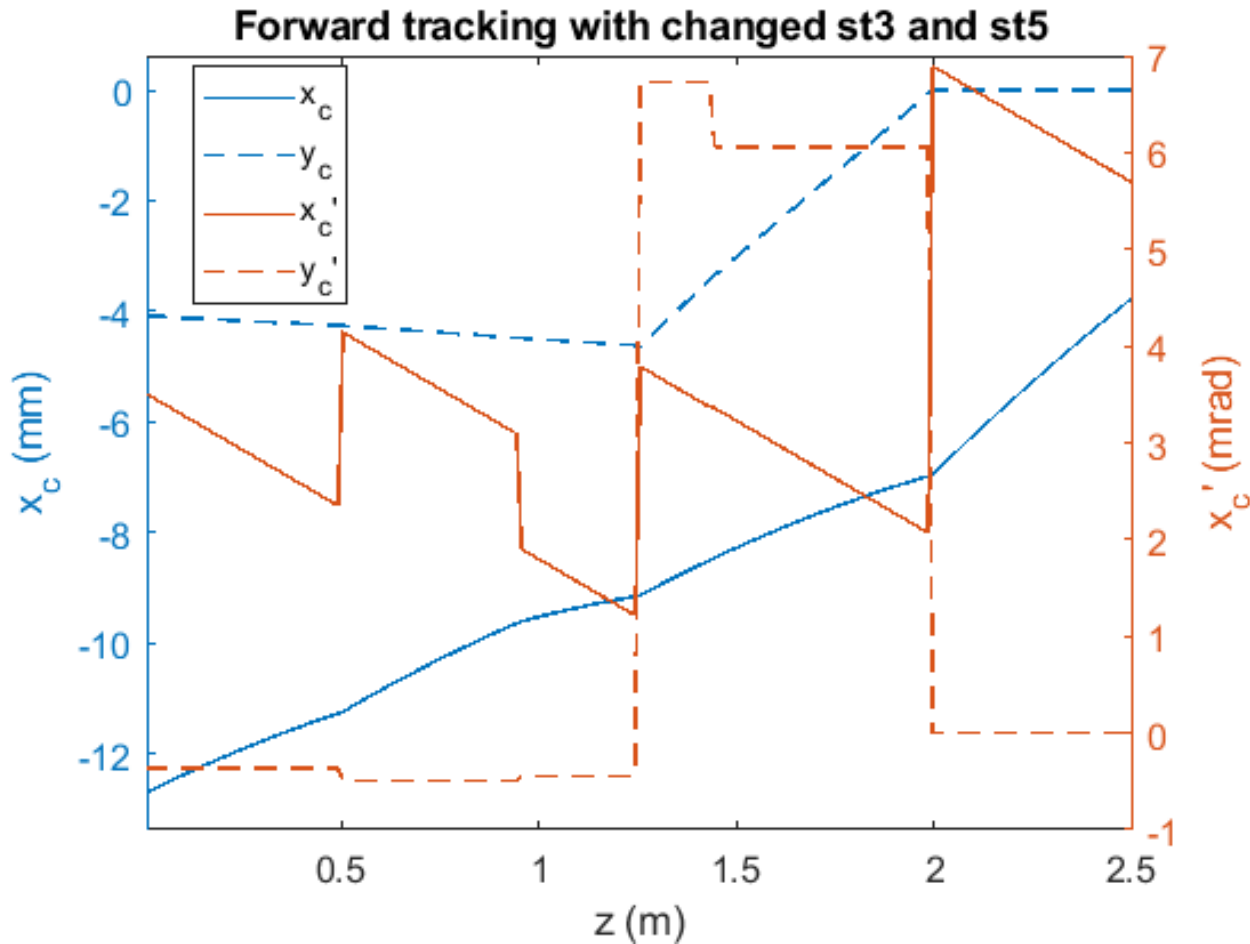

- Now the entering angle and position is known → calculate effect of steerers
 - Every steerer is assumed to be infinitesimally thin → effect is a perfect angle 'kick'
 - Backward tracking through all kicks to find coordinates at electron creation
 - Include known strengths/couplings of steerers and EMF
- Change steerer currents to aim particle into optimal position/angle

Steering

Two solutions: change four (2x/2y) or five (3x/2y) steerers

Adding more steerers → more DOF → 'smoother' solutions possible (minimize kick)

Measurements June 2022

Measurement prediction

Idea:

- In June 2022 booster BBA was performed, done by changing a steerer current and seeing if disp. improves
- Script should predict a new measurement starting from a prev. one if given the change in currents
- For higher accuracy two given measurements were used to predict a third
- Given two sets of currents
 - find predicted change $\Delta x/\Delta x'$ between these two (no influence of const. fields)
 - fit simulated curves to meas. while enforcing sim. must differ by $\Delta x/\Delta x'$ (room for $\pm 0.2 \text{ mm/mrad}$)
 - add term ensuring relative coordinate change between simulation is the same as in measurement
 - goal function looks like this: (the subscript 0 indicates being centered at zero)

$$G(x_1, x_2, x_{sim1}, x_{sim2}) = (x_{1,0} - x_{sim1,0})^2 + (x_{2,0} - x_{sim2,0})^2 + \alpha \cdot |\overline{(x_2 - x_1)} - \overline{(x_{sim2} - x_{sim1})}|$$

Measurement prediction

$$G(x_1, x_2, x_{sim1}, x_{sim2}) = (x_{1,0} - x_{sim1,0})^2 + (x_{2,0} - x_{sim2,0})^2 + \alpha \cdot |\overline{(x_2 - x_1)} - \overline{(x_{sim2} - x_{sim1})}|$$

- Advantages:
 - Predict absolute measured coordinates
 - Two fits are used, influenced less by noise on one measurement
 - Control α to influence importance of **relative** coordinate change in fit
- Conditions for good script:
 - Visual agreement of prediction and real measurement (shape of curve)
 - x/x' are correctly predicted ('real' values found by just fitting the new measurement)
 - Absolute coordinate correctly predicted
 - Goal function correctly predicted

Measurement prediction

X-direction, $\alpha = 0.05$

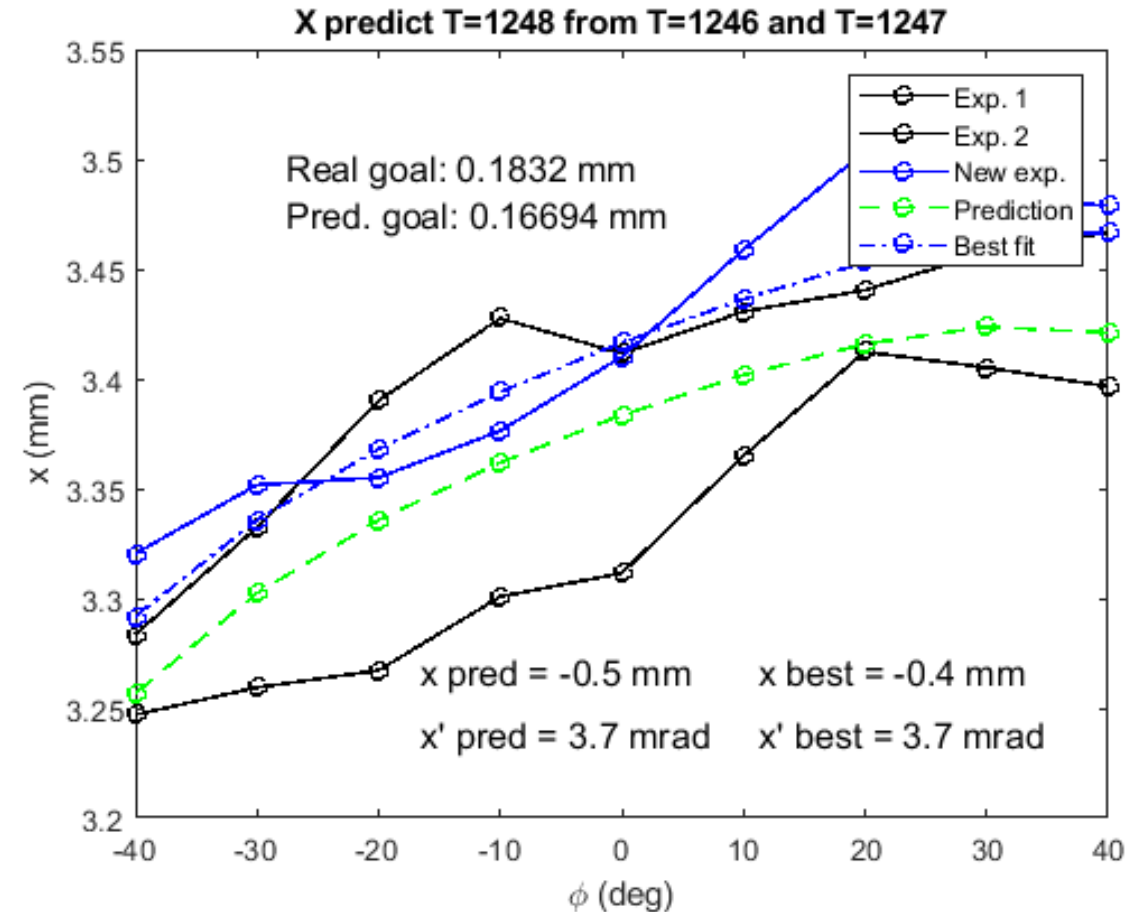

- Test case: 4th of June morning shift booster BBA
- Files T=1246, T=1247 & T=1248 only change St5-Ver:
I: 4.5 \rightarrow 3.5 \rightarrow 2.5
 \rightarrow use first two to predict third
- X: shouldn't change, coupling is too small
- Measurement: increase in x of about .2mm

Measurement prediction

X-direction, $\alpha = 0.05$

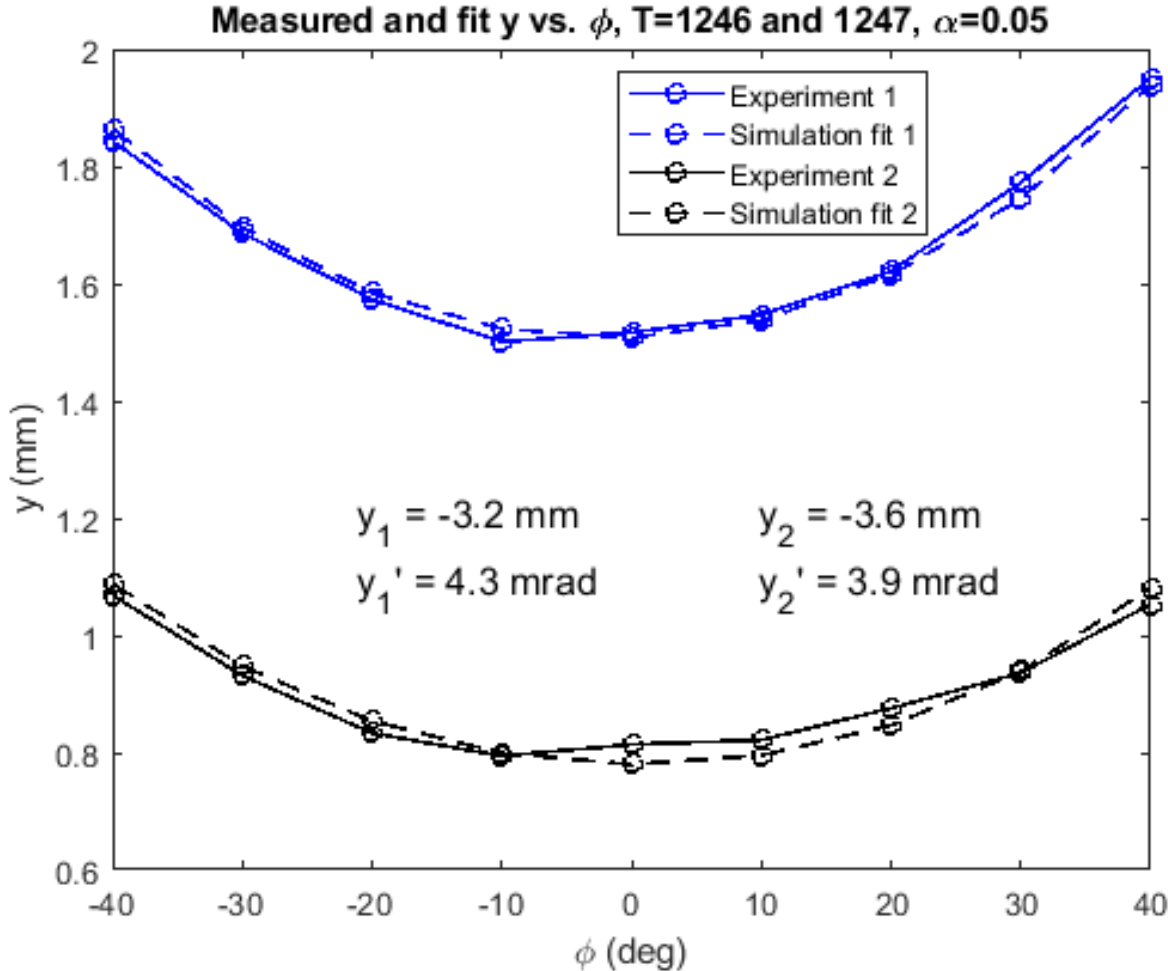

- Test case: 4th of June morning shift booster BBA
- Files T=1246, T=1247 & T=1248 only change St5-Ver:
l: 4.5 \rightarrow 3.5 \rightarrow 2.5
 \rightarrow use first two to predict third
- X: shouldn't change, coupling is too small
- Measurement: increase in x of about .2mm
- Black: input measurements
- Blue: output measurement and it's best fit
- Green: predicted measurement
- Angle/pos. prediction is fine, absolute coordinate not exact

Measurement prediction

Y-direction, $\alpha = 0.05$

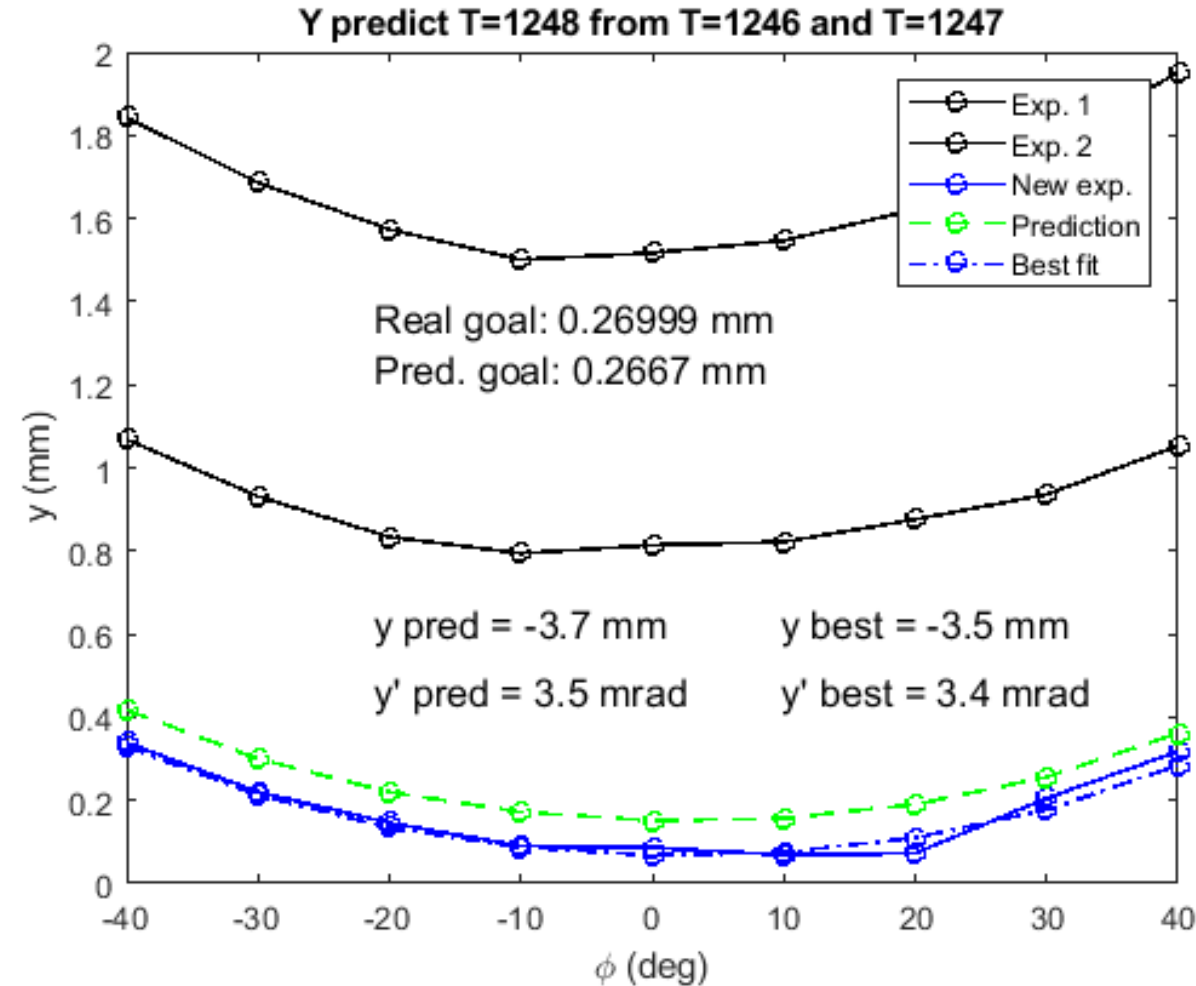

- Files T=1246, T=1247 & T=1248 only change St5-Ver:
l: 4.5 \rightarrow 3.5 \rightarrow 2.5
 \rightarrow use first two to predict third
- Y: decreases every time, which is correct

Measurement prediction

Y-direction, $\alpha = 0.05$

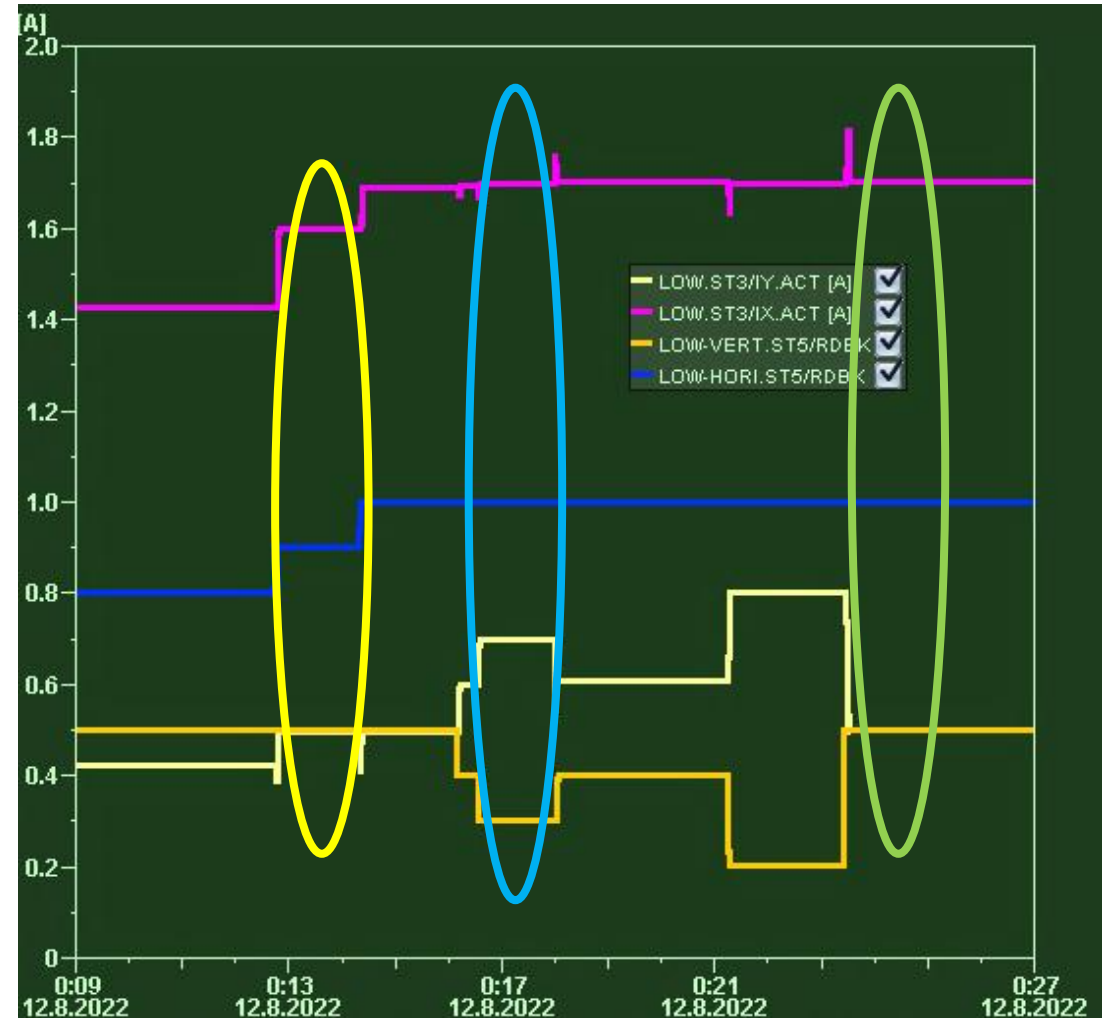

- Files T=1246, T=1247 & T=1248 only change St5-Ver:
I: 4.5 \rightarrow 3.5 \rightarrow 2.5
 \rightarrow use first two to predict third
- Y: decreases every time, which is correct
- Black: input measurements
Blue: output measurement and its best fit
Green: predicted measurement

Measurements week 32 of 2022

Measurement prediction

- Test case: use two measurements to predict final booster BBA in less steps
 - Use **T=0013** and **T=0017** since all four used steerer-currents are different
- Predict **T=0024** (final booster BBA)

Measurement prediction

X-direction, $\alpha = 0.05$

Measurement prediction

Y-direction, $\alpha = 0.05$

- Fit less good \rightarrow prediction less good as well

Current problems and outlook

rest of project

Current problems and outlook rest of project

Conclusion based on measurement data:

- Data fit and steerer correction method have been developed
- Angles are predicted well enough, resulting positions not always great
 - these are the same 'symptoms' as something being wrong with calibration/coupling measurements (dating back to 2019) or the Astra sim. (the EMF used in simulation may not be good)

To do:

- Redo calibration (some steerers were removed and reinstalled during installation gun 5)
- Test script for predicting optimal steerer currents, if necessary do it iteratively
- Somehow measure/calculate exact static fields across booster for improved Astra sim. and fitting
