# SP=50, + Amplitude slope

Artificial Amplitude slope to reproduce  $\langle Pz \rangle(t)$

$$\text{slope} = -0.001 \frac{\text{MV}/m}{\mu\text{s}}$$

# Beam energy slope correction with amplitude slope

09.06.2021M (TW, MK)

How to introduce Amplitude/Phase slope

The image displays a complex control interface for an LLRF system. It includes several key components:

- gun\_shift\_window.xml**: A control panel for the PITZ GUN with parameters for SET POINT (Amplitude: 56.30 MV, Phase: -38.00 deg), PULSE TIMING (Filling: 30, Raising: 15, Flattop: 185, Falling: 1), FEEDBACK (Output Vector Corr, Fast Feedback, Feedforward Corr), and Output Scaling (Scale: 0.98, Phase: -102.10).
- Amplitude and Phase Plots**: Two graphs showing the beam's amplitude (MV/m) and phase (deg) over time (test). The amplitude plot shows a step increase from ~56.0 to ~56.3 MV/m, and the phase plot shows a corresponding step change from ~-47.5 to ~-48.5 deg.
- LLRF Setpoint Params**: A window showing Setpoint Tables and Hardware RBV plots, both displaying a step function over 1600 test units.
- Setpoint Control**: A panel with checkboxes for Feedforward, SP Corr Enable, and SP Smoothing Enable. It includes Setpoint Value (A: 5.00 MV/m, P: -49.00 deg) and Slope Corr parameters (A: ±0.35, P: ±0.00).
- Slope Corr Panel**: A detailed view of the slope correction parameters, showing A: ±0.35 and P: ±0.00, with 'H' buttons for manual adjustment.
- Feed Forward + Learning FF**: A panel with checkboxes for Feed Forward On, Correction Tables, and I FF Enable. It includes Output Vector Correction parameters (A: 1.0000, P: -102.10, Ratio: 1.000).
- Feedback**: A panel with checkboxes for FR, MIMO, and Output limiter (Enable).
- Output limiter**: A panel with a checkbox for Enable and a value of 85.00.
- Pulse settings**: A panel with parameters for Delay, Filling, and Hattp.
- Virtual Probe**: A panel with buttons for I limiter, Info, Timing, Ref, ADC 3, ADC 4, VM, Pulse, SmPred, VP CAL, and Step Corr.
- Watchdog**: A panel with buttons for Systems, xZlimer, and llrictrl.

# Beam energy slope correction with amplitude slope

09.06.2021M (TW, MK)

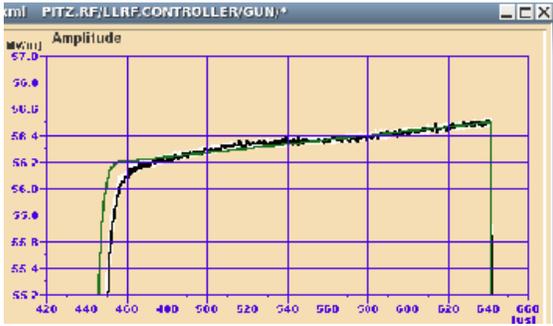

How to introduce Amplitude/Phase slope

The screenshot displays the LLRF control interface with several key panels:

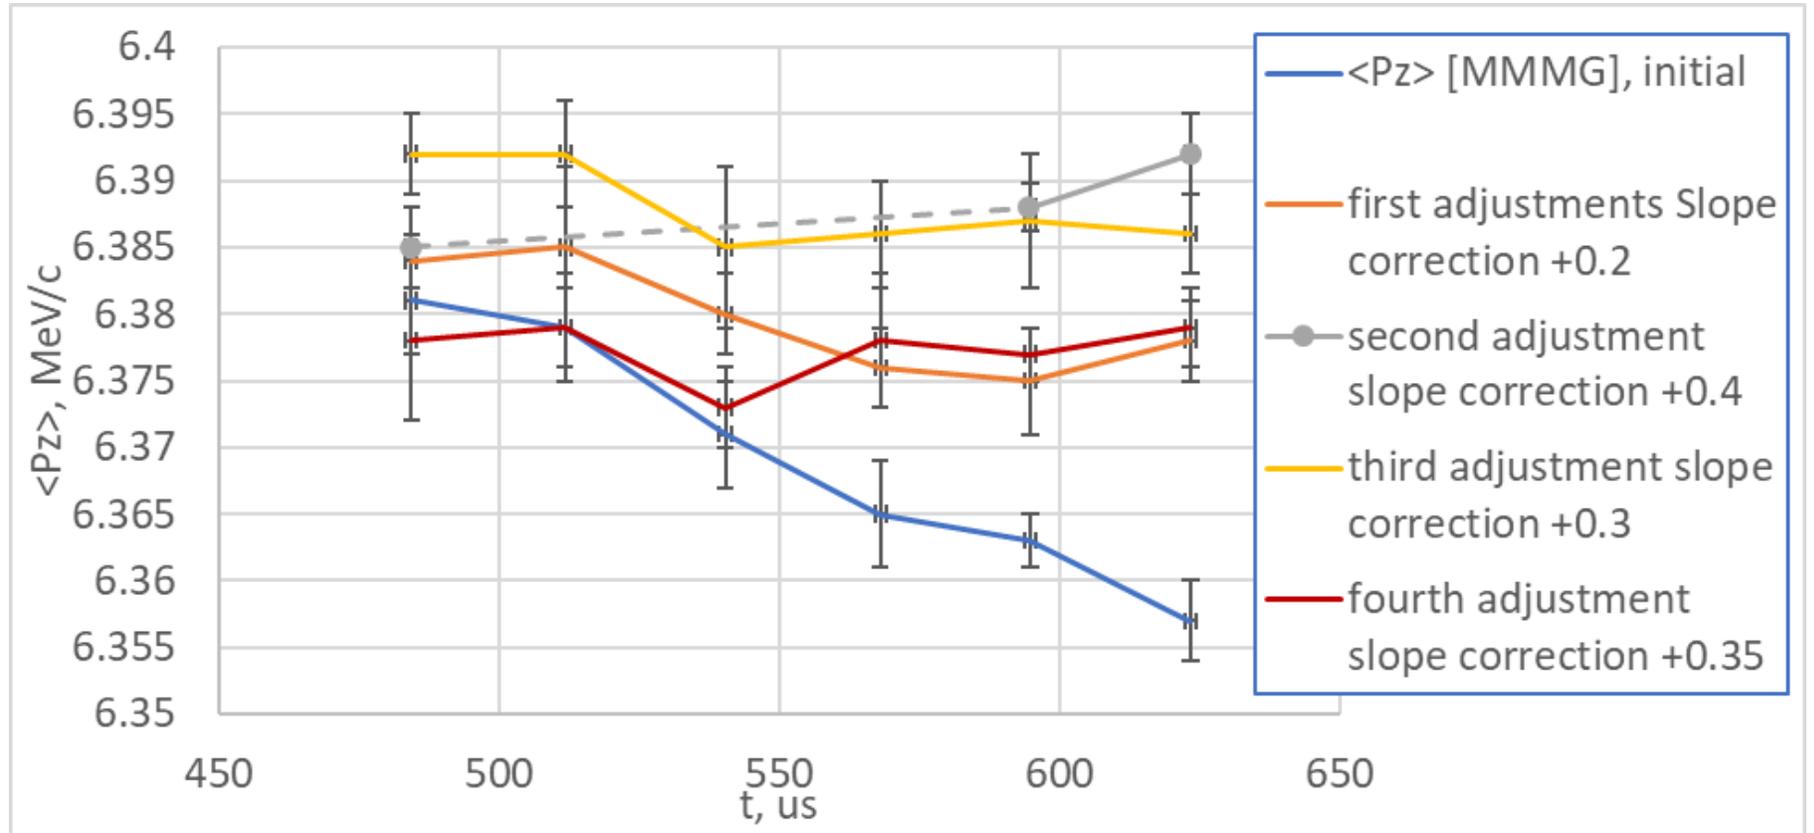

- gun\_shift\_window.xml PITZ\_RF/LLRF.CONTROLLER/GUN\*:** Contains control parameters for the gun.
  - SET POINT:** Amplitude: 56.30 MV, Phase: -38.00 deg.
  - PULSE TIMING:** Filling: 30, Raising: 15, Flattop: 185, Falling: 1.
  - FEEDBACK:** Output Vector Corr: OFF, Fast Feedback: ON, Feedforward Corr: ON, Learning FeedForward: OFF, FR Gain: 2.00.
  - Output Scaling:** Scale: 0.98, Phase: -102.10.
  - Status:** ADCLimiter: OK, LFF: resetting LFF tables, ORC: /disabled.
- Amplitude and Phase plots:** Two graphs showing the beam's amplitude (MV/m) and phase (deg) over time (test). The amplitude plot shows a step increase from ~55.5 to ~56.5 MV/m. The phase plot shows a step change from ~-45 to ~-50 degrees.
- LLRF Setpoint Params:** A window titled "LLRF Setpoint Params" with a "RPC test" button. It contains:
  - Setpoint Tables:** A graph showing a step change in setpoint value from 0 to 3000.
  - Hardware RBV:** A graph showing a step change in hardware readback value from 0 to 3000.
  - Setpoint Control:** Feedforward (unchecked), SP Corr Enable (checked), SP Smoothing Enable (checked).
  - Setpoint Value:** A: 5.00 MV/m, P: -49.00 deg.
  - Slope Corr:** A: ±0.35, P: ±0.00.
  - SP table:** max: 70.0 MV/m, delay: 1.4 μs.
- Feed Forward + Learning FF:** Feed Forward On (checked), Correction Tables (Reset), I FF Enable (unchecked).
- Feedback:** FR (checked), MIMO (checked), Output limiter (checked), Pulse OK? (green).
- Output Vector Correction:** A: 1.0000, P: -102.100, Ratio: 1.000.
- Pulse settings:** Delay: 47 μs, Filling: 30 μs, Flattop: 185 μs.
- Buttons:** matlab tools, LLRF Special, Overview, WC (choose), RPC test.

# Beam energy slope correction with amplitude slope (SP=56.2)

09.06.2021M (TW, MK)

Slope=0.35 over  
185us RF flattop

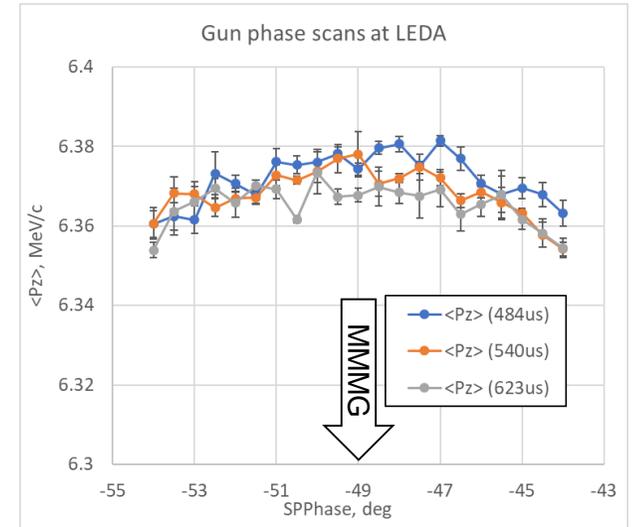

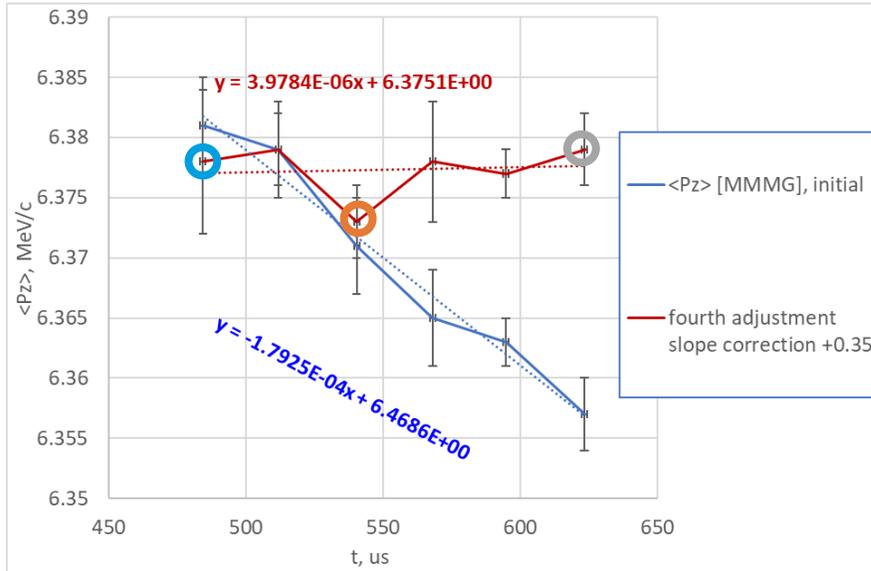

# Beam energy slope correction with amplitude slope (SP=56.2)

09.06.2021M (TW, MK)

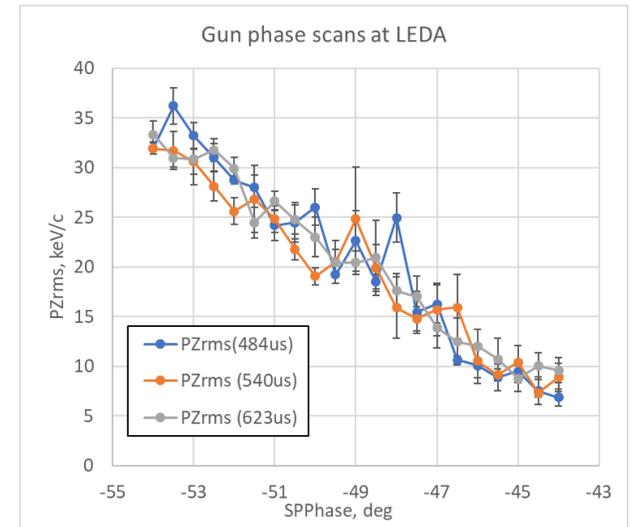

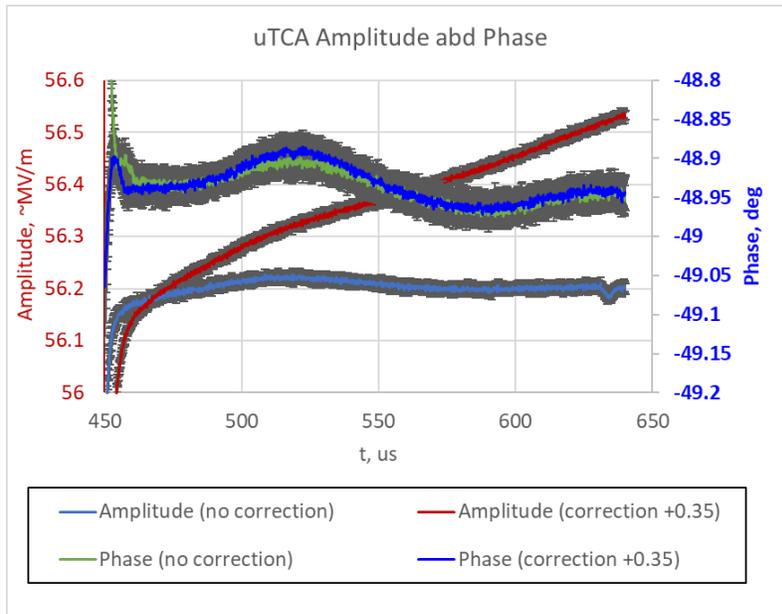

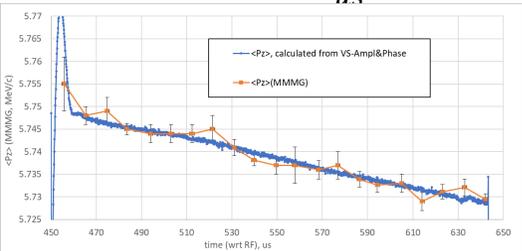

used

$$\text{slope} = \frac{0.35}{185} = 0.00189 \frac{\text{MV/m}}{\mu\text{s}}$$

NB: Estimated for SP=50

$$\text{slope} = -0.001 \frac{\text{MV/m}}{\mu\text{s}}$$

# Summary

## Beam energy slope correction

- Electron beam energy slope along the RF gun pulse has been observed for the nominal settings at PITZ
  - LEDA measurements by scan A3 (laser)
  - Slopes  $\sim -3 \cdot 10^{-5} \frac{d \log \langle P_z \rangle}{dt}$  are well measurable at e.g. MMMG phase
  - Cannot be explained by measured amplitude/phase profiles (very flat)
- The  $\langle P_z \rangle$  slope can be compensated by introducing a positive amplitude slope
  - For SP=56.2 the slope -0.35 over 185 us flattop RF pulse ( $0.0019 \frac{MV/m}{\mu s}$ )  
→ the momentum slope  $\sim +6 \cdot 10^{-7} \frac{d \log \langle P_z \rangle}{dt}$  (0 within error bars)
  - Well agreed with estimated slope  $-0.001 \frac{MV/m}{\mu s}$  to explain results for SP=50
- Still it is not clear where the slope comes from (RF power coupler kick, beam loading, uTCA measurement artifact ( $\beta(t)-?$ ), ....?)
- How to improve the tuning procedure:
  - Long pulse train (low charge, small BSA, e.g. Pharos 0.1 MHz) → minimize energy spread at LEDA at MMMG phase?
  - Fine tuning resonance/FB
  - ...?

# Backup

# Regular studies of the beam energy slope along the RF pulse

## Measurement program

1. SPA=SPA0=56.2(?), Sharp gun resonance ( $|\text{slope}| \sim < 5$ ), stabilize water (incl. valves), setup FB
2. Find first pulse location w.r.t. VS signals (uTCA) --> Ampl(1),Phase(1) (I still have some questions to the procedure, see the last slide in the attached file)
3. LEDA scan around MMMG using 1 pulse (if possible), recording VS-amplitude&phase especially at the location of the 1st pulse (found in p.2) -->  $\langle Pz \rangle(\text{Ampl}(1), \text{Phase}(1))$  --> vector
4. SPA=SPA $\pm$ 0.5, repeat 1-3
5. Form a matrix  $\langle Pz \rangle(\text{Ampl}(1), \text{Phase}(1))$ , based on that we can plot expected  $\langle Pz \rangle$  profile along the RF pulse  $\langle Pz \rangle(\text{Ampl}(n), \text{Phase}(n))$  for e.g., SP0, then we can compare it with the measured  $\langle Pz \rangle$  by shifting A3 event (laser).
