

Beam dynamics study of RF and solenoid fields for PITZ gun without space charge

OUTLINE

- SETUP
- SIMULATION STUDY
- EXPERIMENTAL STUDY
- CONCLUSION

Zeuthen, 6/8/2015

PITZ beamline

Screen 1 Screen 2 Screen 3

Simulation – Experimental SETUP

- > Beam charge (20pC)
- > Gaussian longitudinal and uniform transverse distribution
- > Grid is used to shape the beam
- > Imaging at Low Screen1 , Low Screen2, Low Screen3
- > Magnetic field is computed by the formula:

$$B_{z,main}[T] = 5.889 \times 10^{-4} * I_{main}[A] + 7.102 \times 10^5$$

- > Experimental data from 17/06/2015 (5MW in the Gun)

Grid after the cathode.

I_{main} : solenoid current from experiment
 B_z : magnetic field of solenoid in simulation

Simulation Study

Low Screen 1

$B = 0.272$
 $I = 462.5A$

Low Screen 2

$B = 0.249$
 $I = 423.6A$

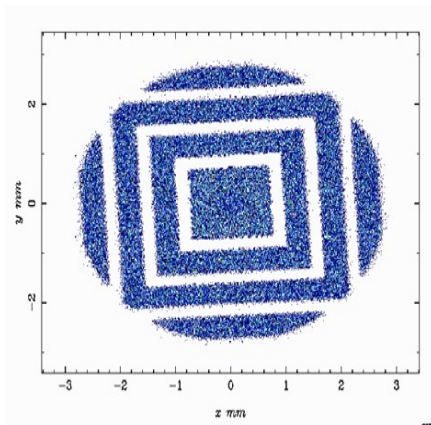

Low Screen 3

$B = 0.234$
 $I = 397.1A$

Experimental study

Data
(17/6/2015
Morning shift)

Low Screen 2
B = 0.249

Low Screen 3
B = 0.234

2.8

2.9

Magnification

SUMMARY

- Grid image is rotated by the magnetic field of the solenoid.
- Magnification factor has to be confirmed.
- Simulation in accordance with the experimental imaging data.
- The calibration formula for the longitudinal magnetic peak field of the solenoid magnet seems consistent.
- More experimental data for 3MW in the Gun.
