

E-beam transverse focusing for beam plasma interaction studies

- Transverse focusing of 22 MeV electron beam using 3 quadrupoles in high section
- Summary

Martin Khojyan
PITZ Physics Seminar
Zeuthen, 08.08.2013

Goal and parameters for ASTRA simulations

Requirements for an electron beam with 100pC charge:

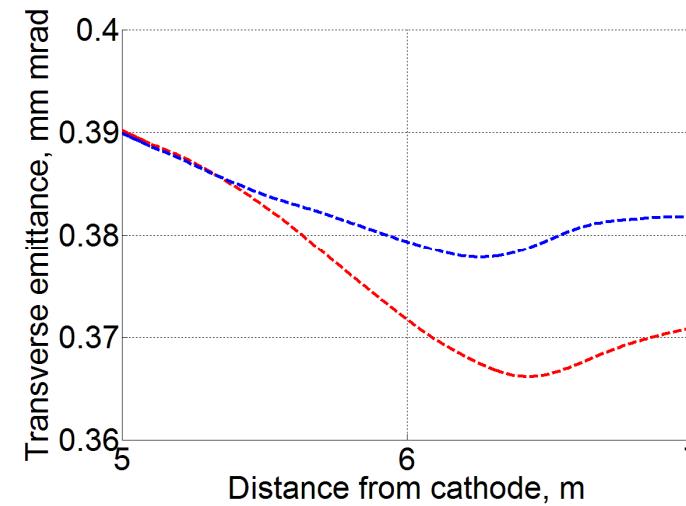

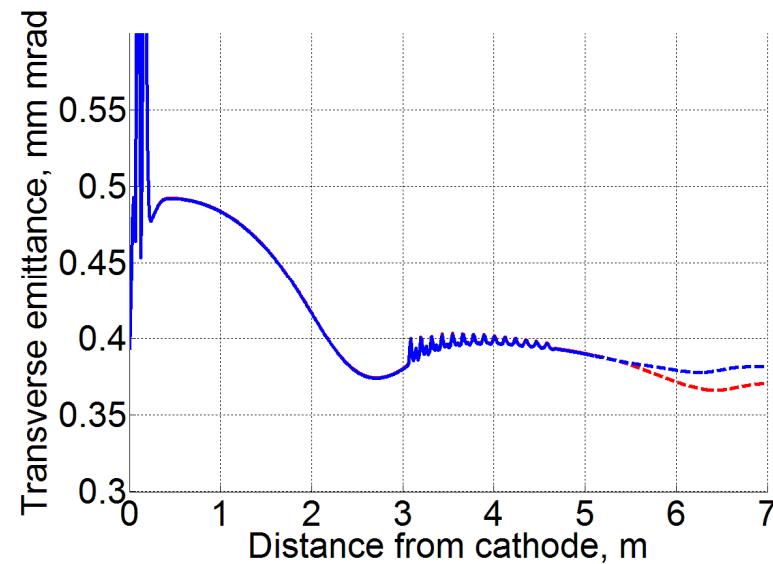

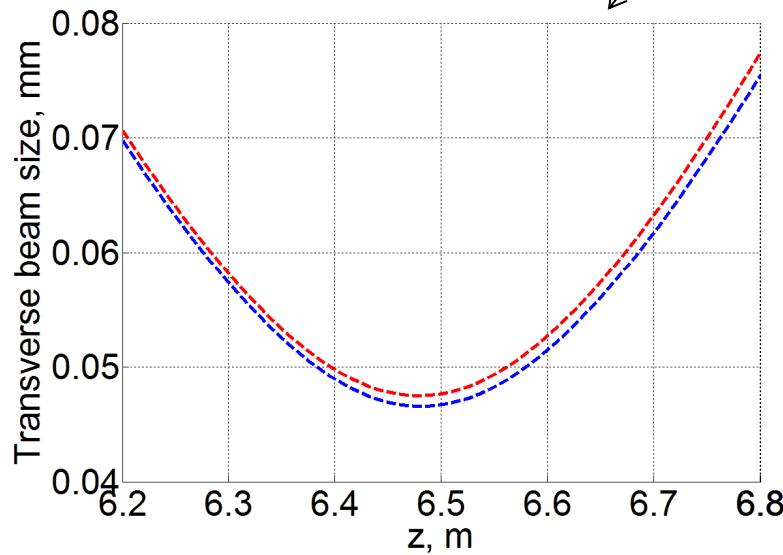

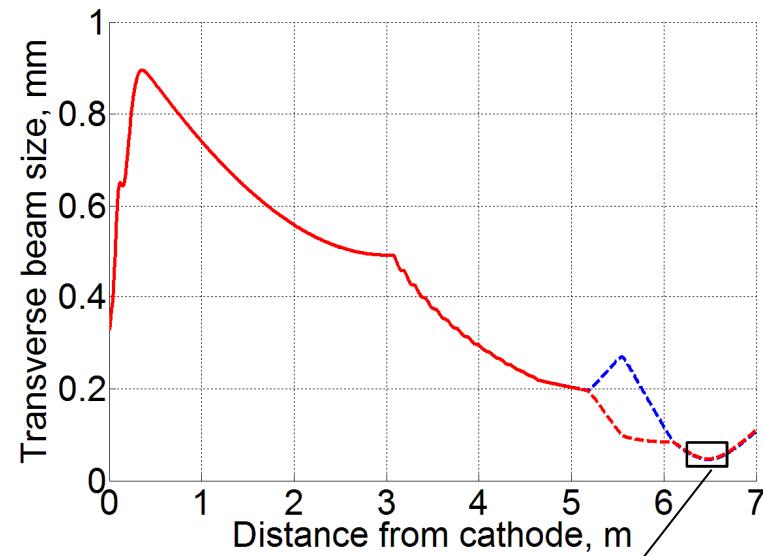

- Smooth beam transverse focusing at the entrance / middle of plasma cell ($z = [6.45-6.55]$ m)
- Transverse beam rms size $\rightarrow \sigma_{xy} = \sqrt{\sigma_x \cdot \sigma_y} \sim 50\mu m$

Setup for beam simulations

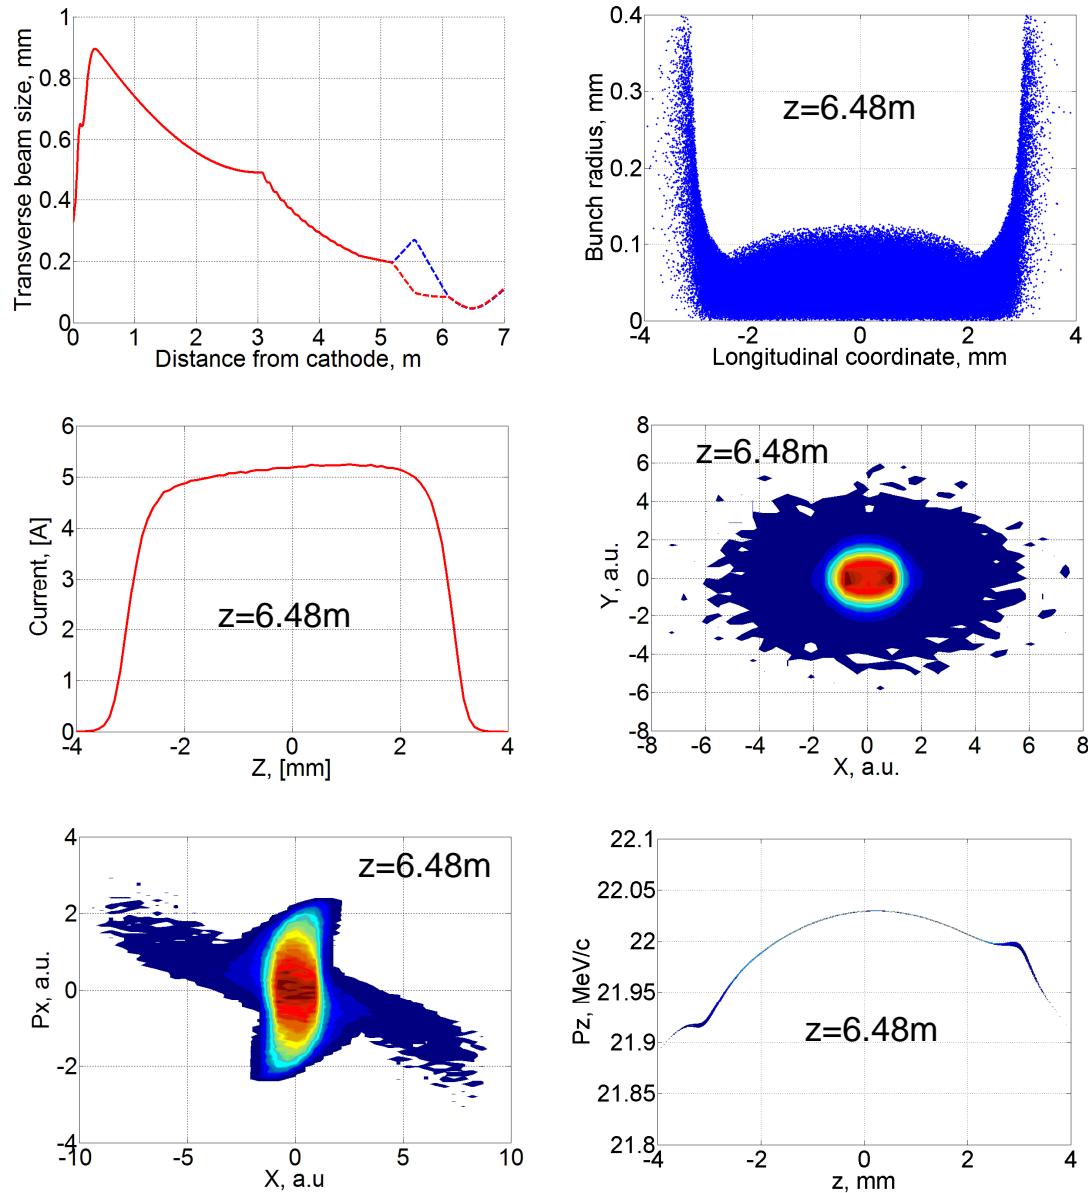

- Laser: Longitudinally flat-top $\rightarrow 2/22/2$ ps. Transverse rms spot size on the cathode $\rightarrow 0.3$ mm
- Gun: Gradient of 61 MV/m (6.73 MeV/c after gun at on-crest phase), phase fixed to on-crest
- Booster: Gradient of 17.5 MV/m (22 MeV/c final beam momentum for gun and booster on-crest phases), phase fixed to on-crest
- Solenoid scan for e-beam focus on EMSY1 (optimum $B(T) = 0.215$ T)
- 3 quadrupoles are used for further beam transverse focusing:
 - High1.Q1 \rightarrow position 5.19m, focusing gradient: $g(T/m)=-1.911$
 - High1.Q2 \rightarrow position 5.55m, focusing gradient: $g(T/m)=3.233$
 - High1.Q3 \rightarrow position 6.1m, focusing gradient: $g(T/m)=-3.086$
- 100pC charge

Beam transverse properties along the PITZ linac

Beam properties at 6.48m after the cathode

Beam parameters	Value
Final beam momentum, MeV/c	22
Total charge, pC	100
Longitudinal beam position, m	6.48
Horizontal beam rms size, um	46.5
Vertical beam rms size, mm	47.5
Bunch length in FWHM, mm	5.93
Final beam energy, MeV	17.6
Peak slice current, A	5.3
Horizontal beam emittance, mm mrad	0.37
Vertical beam emittance, mm mrad	0.38
Gradient of High1.Q1, T/m	-1.911
Gradient of High1.Q2, T/m	3.233
Gradient of High1.Q3, T/m	-3.086
