

# PITZ RC, 31.01.2013

*M.Krasilnikov*

# Weeks 4-5: Plans

- Gun-3.1 + RF Window conditioning
  - Solenoid sweep for higher peak power levels (>5MW). Start: 10us
  - Try to condition MP region ( $I_{main} < 40A$ )
  - Stability tests (night runs):
    - 10Hz x 650us x 6.5MW(or >)  $I_{main}=0A; 315A; 400A$
    - 10Hz x 830us x 5MW(4MW)  $I_{main}=0A$  (315A)
- Cathode box exchange – Mo, 28.01.2013 (short1 is installed)
- CDS booster test run → Tue, 29.01.2013A
- Cs<sub>2</sub>Te cathode conditioning – Wed, 30.01.2013
- PE production – Wed, 30.01.2013
- Longitudinal momentum measurements (LMM)
  1. Preparation (resonance and RF FB tuning, laser BBA)
  2. Gun characterization ->  $P_z$  vs. gun phase for various gun gradients
  3. LPS tomography (DM program)

*Stability tests*

# Gun-3.1 + RF Window conditioning

- Solenoid sweep:
  - 0/10\0us 6.3MW (max) → done
  - 50/100\20us 7.7MW I<sub>main</sub>=0-500A → done\* (e.g. 27.01.2013A)

- CDS booster test run conditions:**
- Gun is off for these tests
  - Vacuum valves between gun and booster are opened
  - HV=10.5kV, 130us flat length, 10us filling and decay time
  - SPTemperature to be tuned for the reflection of ~4-6%
  - Run time (30min) to be counted after the ramping time (both should be recorded)

## Results of CDS test run:

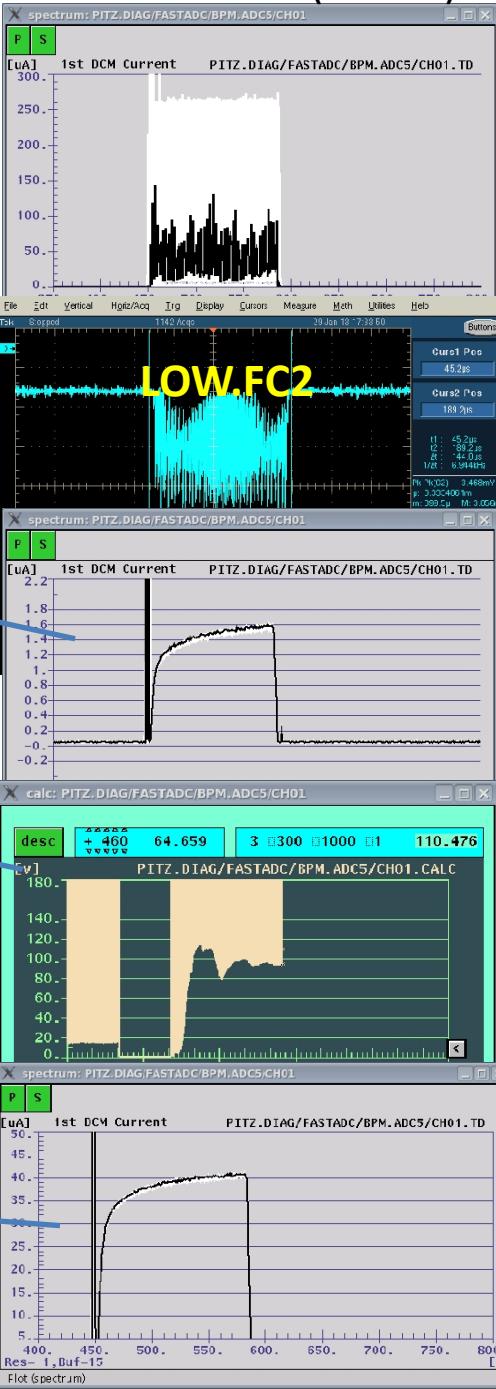

- Up to 4MW for 130us pulses -> no activation increase observed (DC up to 100 uA) after 30min run at each power level
- At 5MW (DC:350uA) -> small activation increase, 10-27% to the remnant level (at the beginning of the shift)
- Double rf pulse duration (130us->260us) pulses at 5MW -> activation is approximately doubled

## Dark current (DCM1)

# CDS booster test run 29.01.2013A

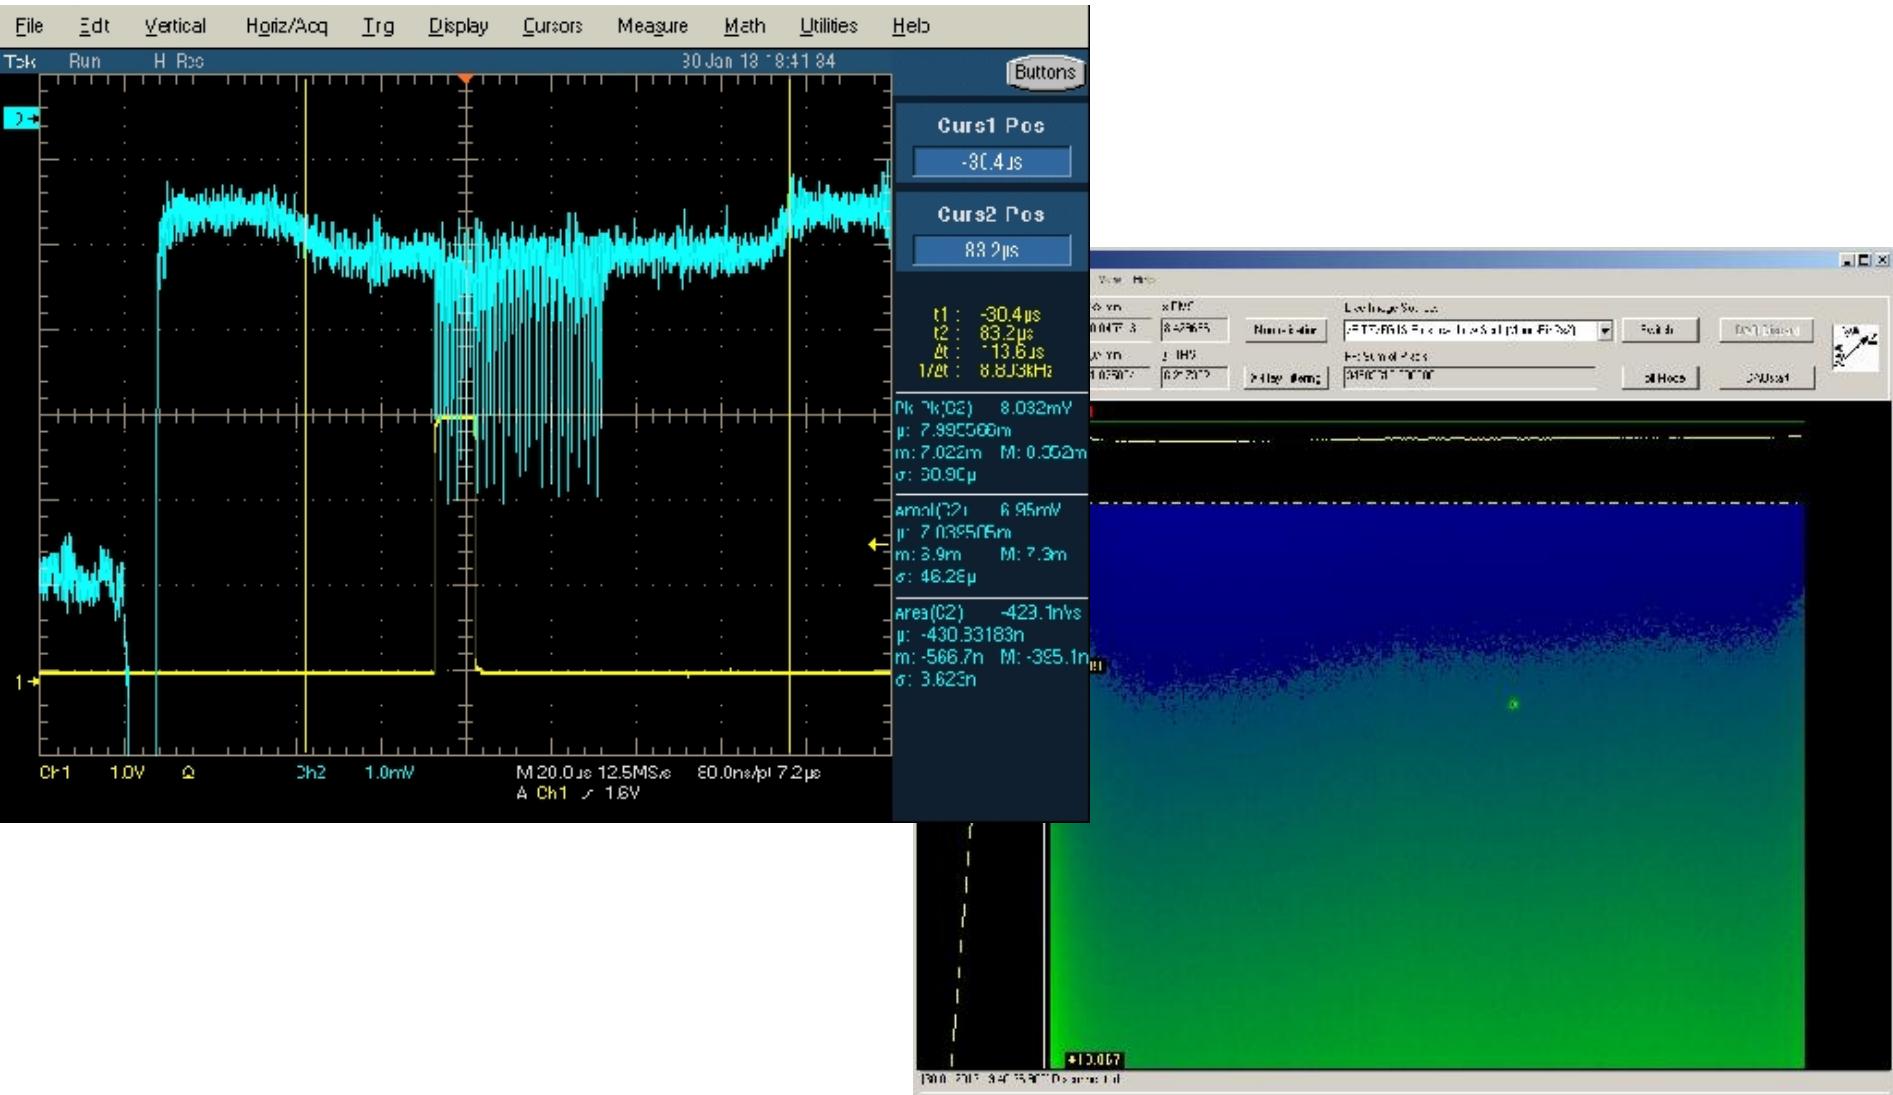

# CDS booster test run: next steps

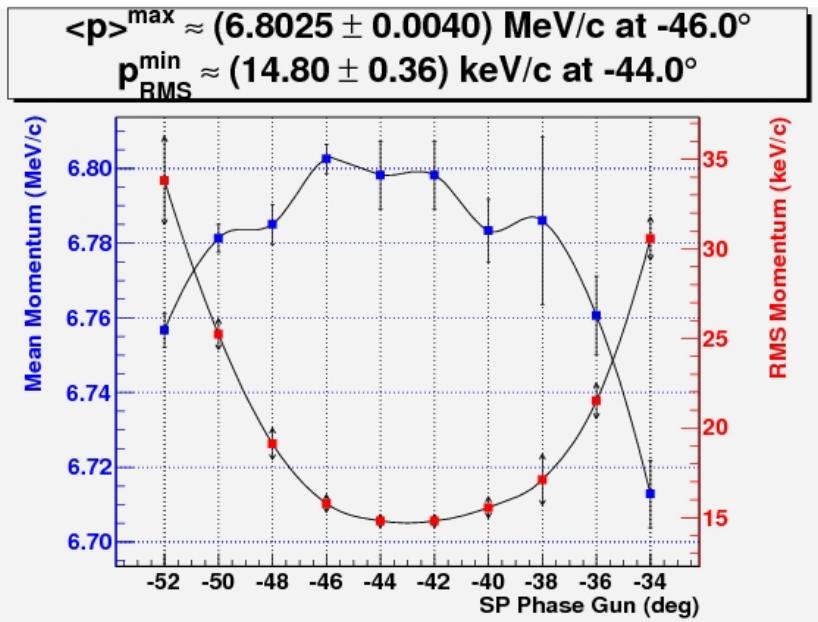

1. This week – booster up to 4MW + monitor the rad. dose after a long run (1shift, 1 day??)
2. Future (?) → 5MW run to find a saturation in the dose rate
3. Future(????) 2 weeks of conditioning?
4. ...

# First photoelectrons from this run

- Cathode box exchange – Mo, 28.01.2013 (short1 is installed) → the cathode #149 (Cs<sub>2</sub>Te standard) inserted on 30.01
- Cs<sub>2</sub>Te cathode short conditioning – 30.01.2013A
- PE production– Wed, 30.01.2013

# New MAMA (OMA) Tests

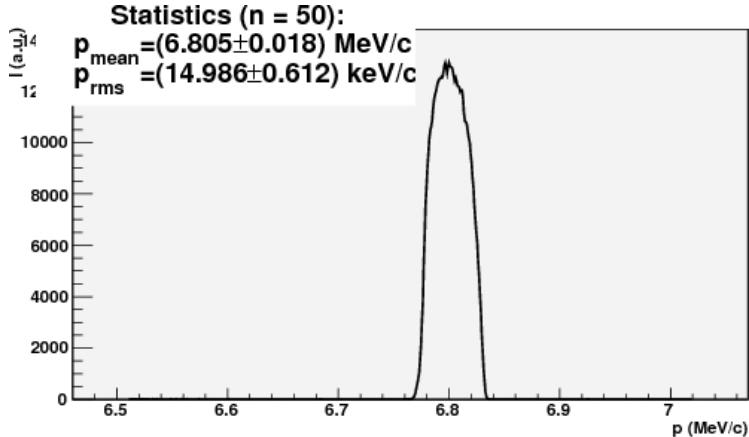

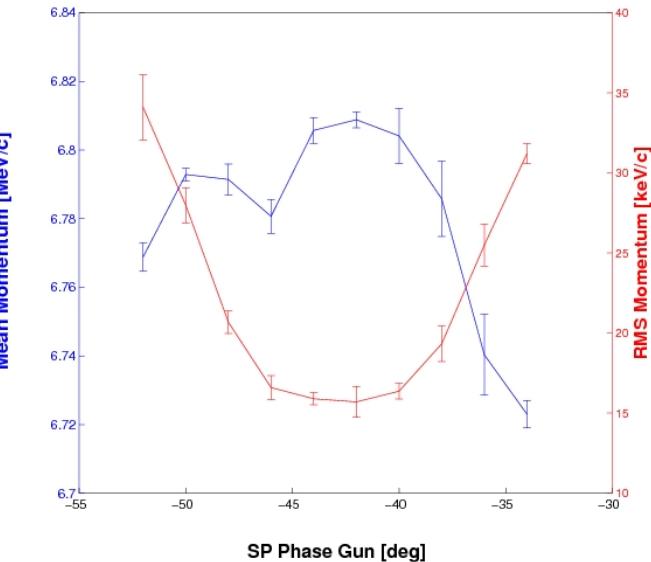

Measured at: LEDA

$\langle p \rangle_{\text{max}} = (6.809 \pm 0.002) \text{ MeV/c at } -42^\circ$

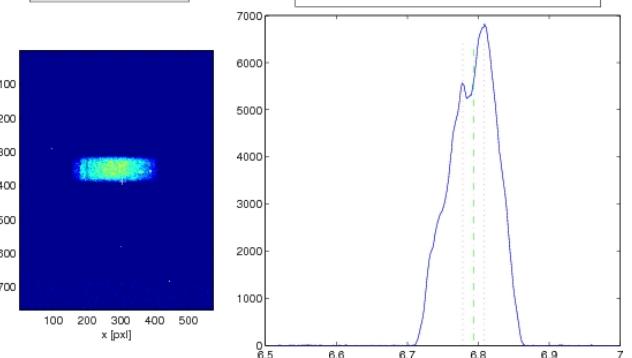

$p_{\text{RMS}} = (16 \pm 1) \text{ keV/c at } -42^\circ$

I <sub>main</sub>	= 479.6A
I <sub>dip</sub>	= -1.8A
10 statistics	
-88 pulses	
LT	= -888%
SP-Pforw	= 65.0
Power	= 7.37MW
Reflection	= 72%

Phase:  $-44^\circ$

Statistics: 20

# Weeks 5-6: Plans

- Longitudinal momentum measurements (LMM)
    1. Preparation (resonance and RF FB tuning, laser BBA)
    2. Gun characterization ->  $P_z$  vs. gun phase for various gun gradients
    3. LPS tomography (DM program)
  - QE and QE map (MO)
  - Solenoid BBA (MK)
  - BPM commissioning (MK)
  - Gun stability measurements ( $|g_l|$ )
    - Phase stability
    - Long Term Tests (LT) – night runs
  - Emittance

# Measurement program 2013/1

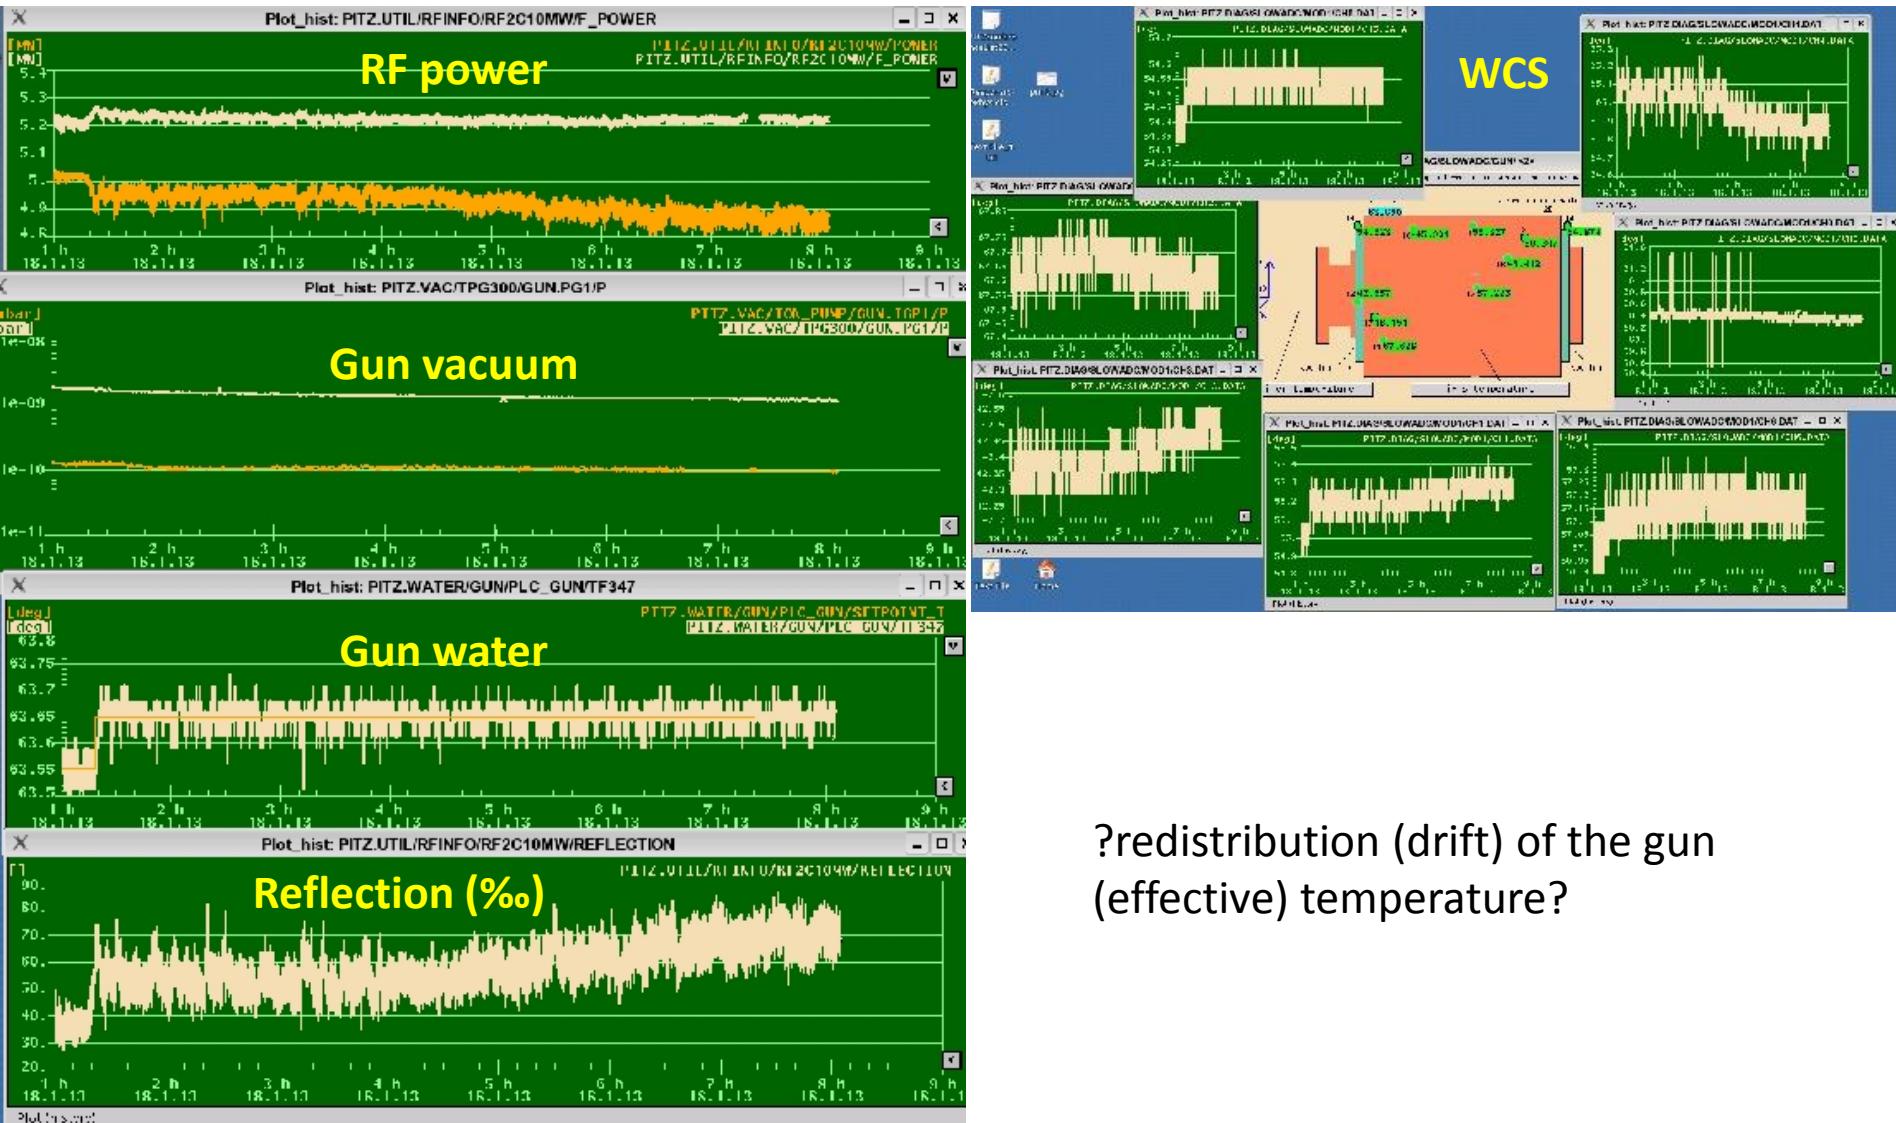

item	Task	Description	Responsible	program available?
1	Gun-3.1 conditioning	+Cs <sub>2</sub> Te cathode	MK	+
2	CDS booster test run		? , MK	+
3	Long. momentum measurements	Gun characterization + data for LPS tomography trial	DM, MK	+
4	Gun stability measurements	Amplitude and phase, + pulse train flatness	Igl	+
5	Emittance measurements	Min emittance for 0.02; 0.1; 0.25;1;2 and 3nC (new), slit scan	MK, GV	
6	Emittance vs. booster gradient	100pC	GV	
7	Emittance vs gun gradient	45 vs. 60MV/m		
8	Emittance vs. laser rt		+MG, GK	
9	Emittance optimization for Gaussian	laser pulse length variation		
10	Emittance along the beam line and tomography	100pC?	GeK	
11	RF gun coupler kick studies	???	MK, Igl	
12	Studies for PWA	Kapton window tests	MG	
13	Solenoid BBA	Still magnetizable parts	MK	+
14	BPM commissioning	Timing + calibration	MK	+
15	Low charge studies	short pulse characterization	BM	+
16	Laser shapes adjustment	Temporal and transverse	GK, MG	

# Problems observed

# Problems observed

Slow drift observed during high average power run:

- 18.01.2013 (N-M): 150kW drop of the rf power in the cavity whereas the forward power was stably running at 5.2MW ( $\sim 5\text{MW} \times 830\text{us} \times 10\text{Hz}$ )

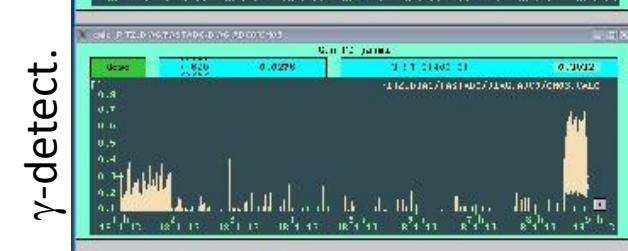

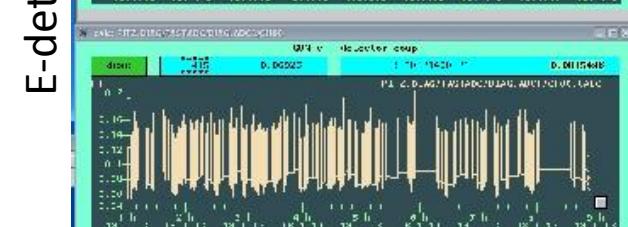

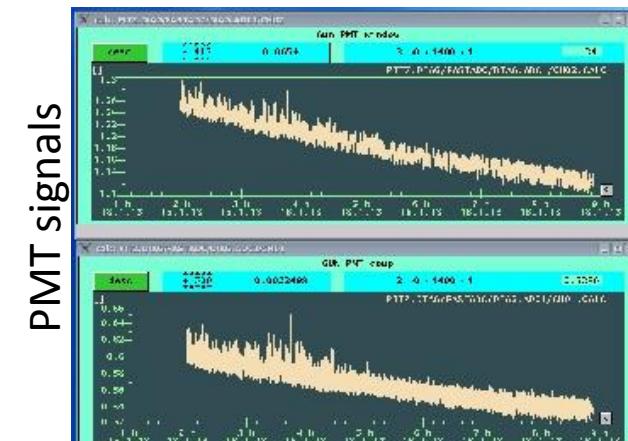

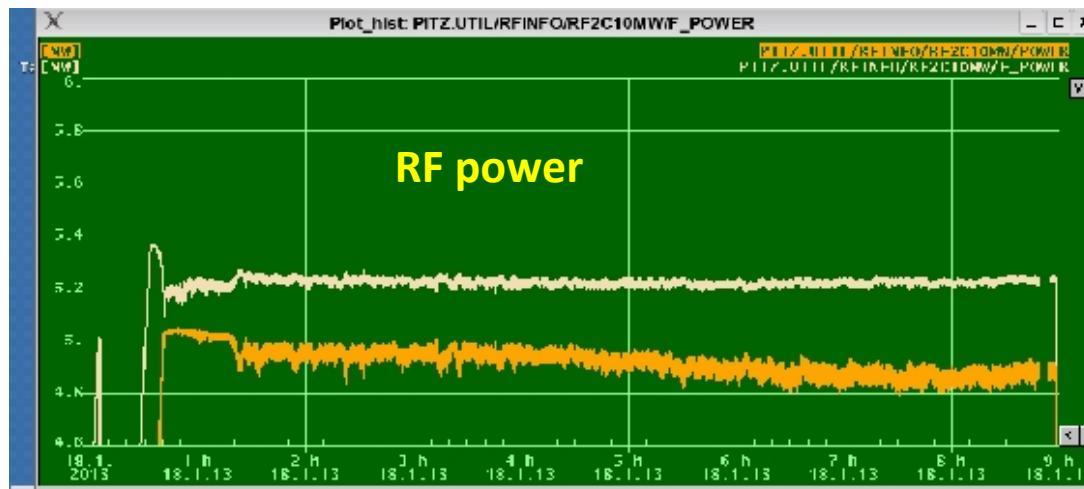

?redistribution (drift) of the gun  
(effective) temperature?

# Problems observed

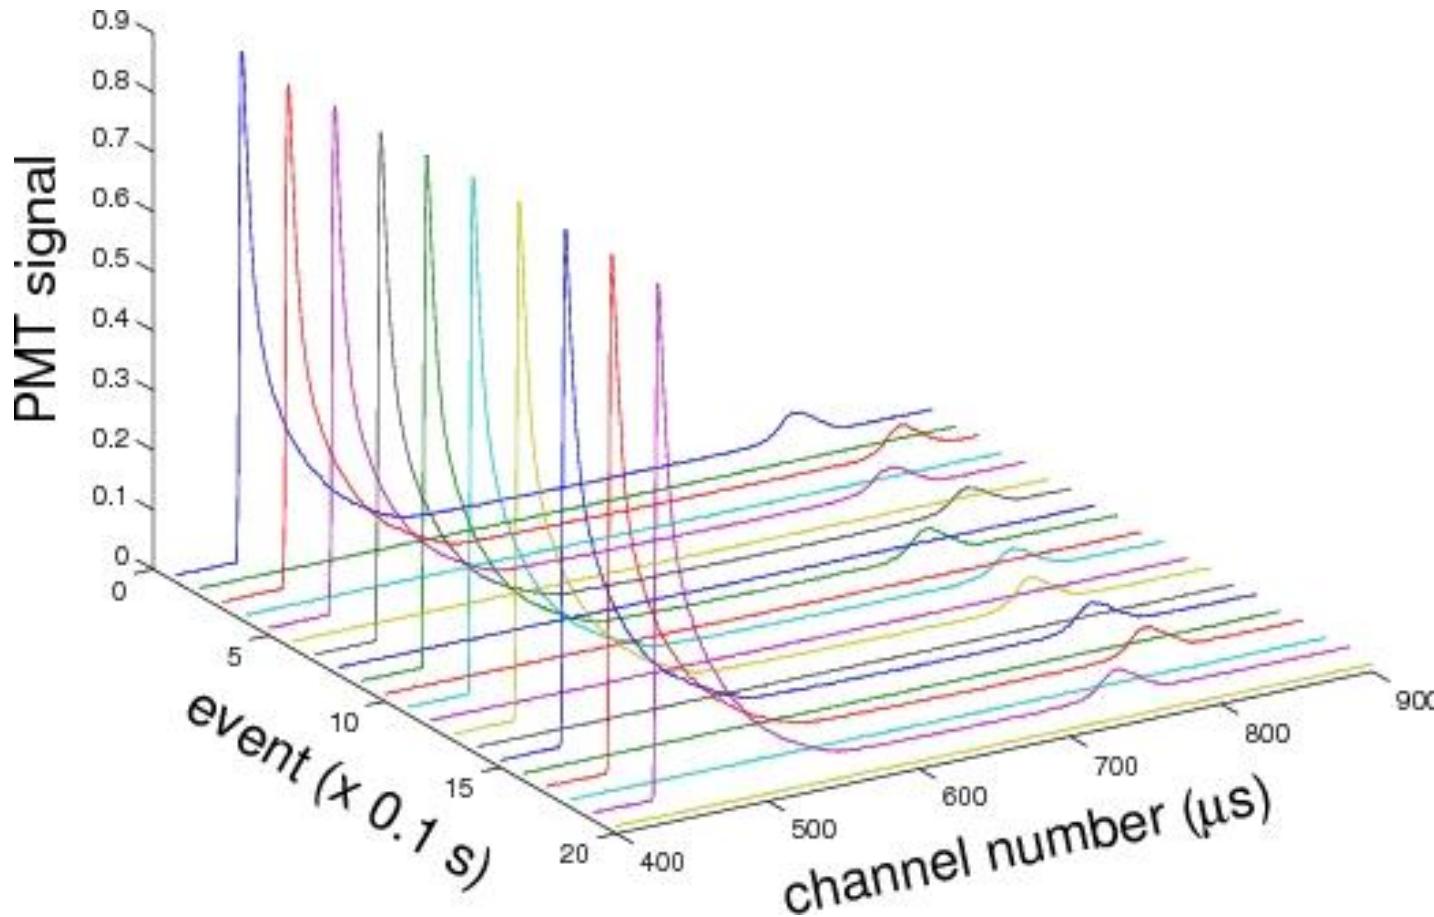

Slow drift observed during high average power run:

- 18.01.2013 (N-M): 150kW drop of the rf power in the cavity whereas the forward power was stably running at 5.2MW ( $\sim 5\text{MW} \times 830\text{us} \times 10\text{Hz}$ )

# Problems observed

PMT signals are unstable at long rf pulses (830us, 4MW) → observed 20.01.2013M

1. Regular PMT signal is missing for each second event (not 0, but noise!) .
2. This happens with both PMTs simultaneously
3. This (up to now) was observed only for 830us rf pulse length
4. The second (small) bump is "traveling" along the pulse.

# Studies of unstable PMT signal (week 3 2013)

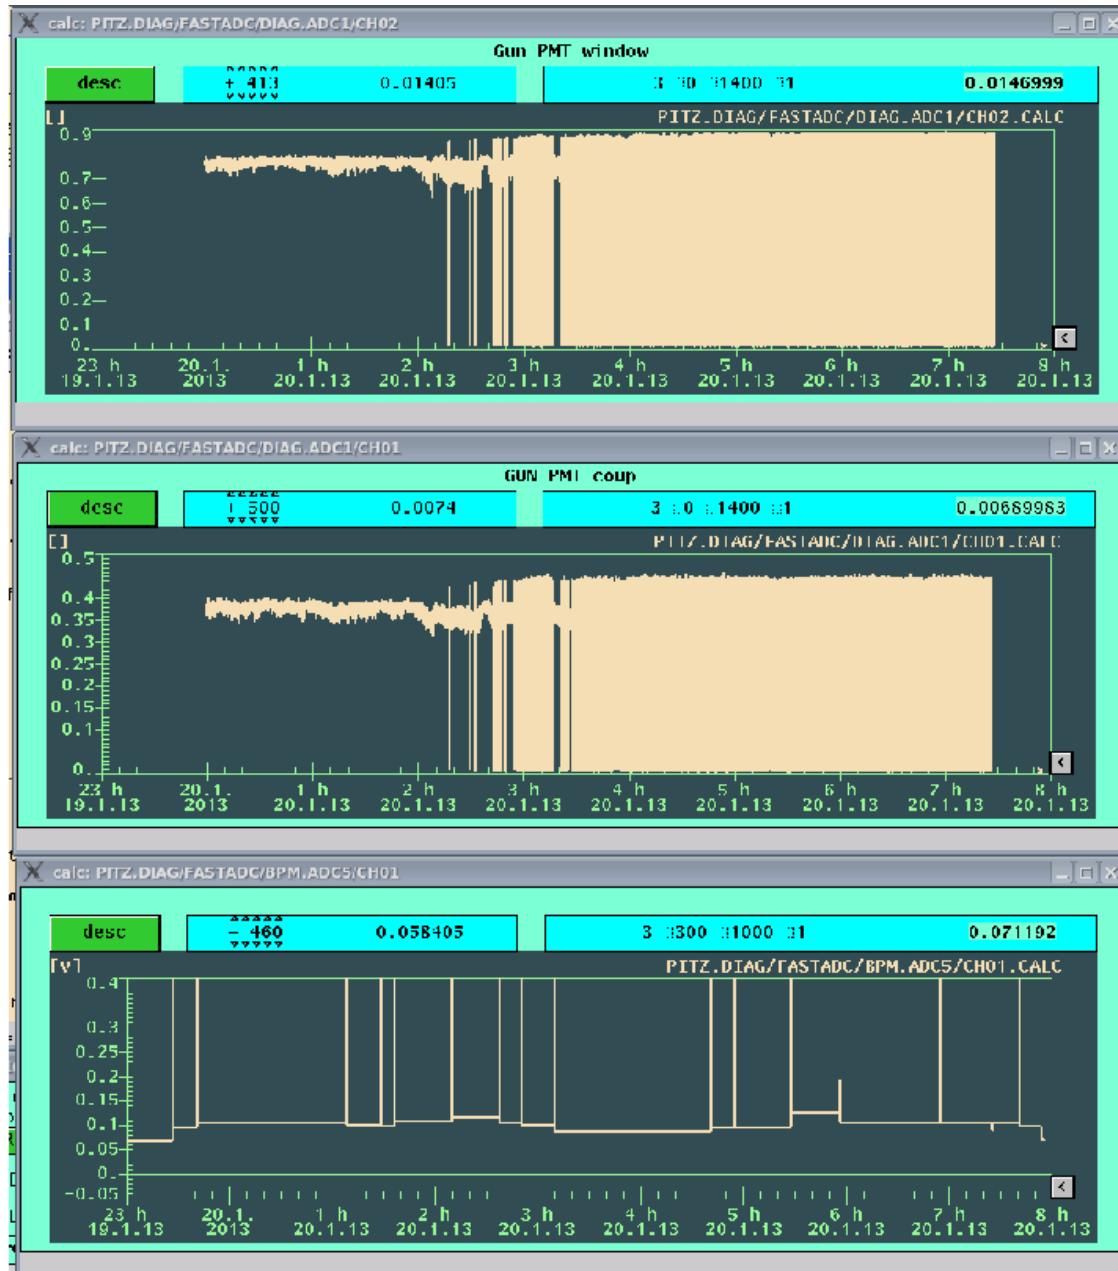

I.Isaev

Time: 19.01.2013 23:30 – 20.01.2013 07:30

Power ~4.15 MW in the gun cavity

Timing settings: 50us/830us\20us

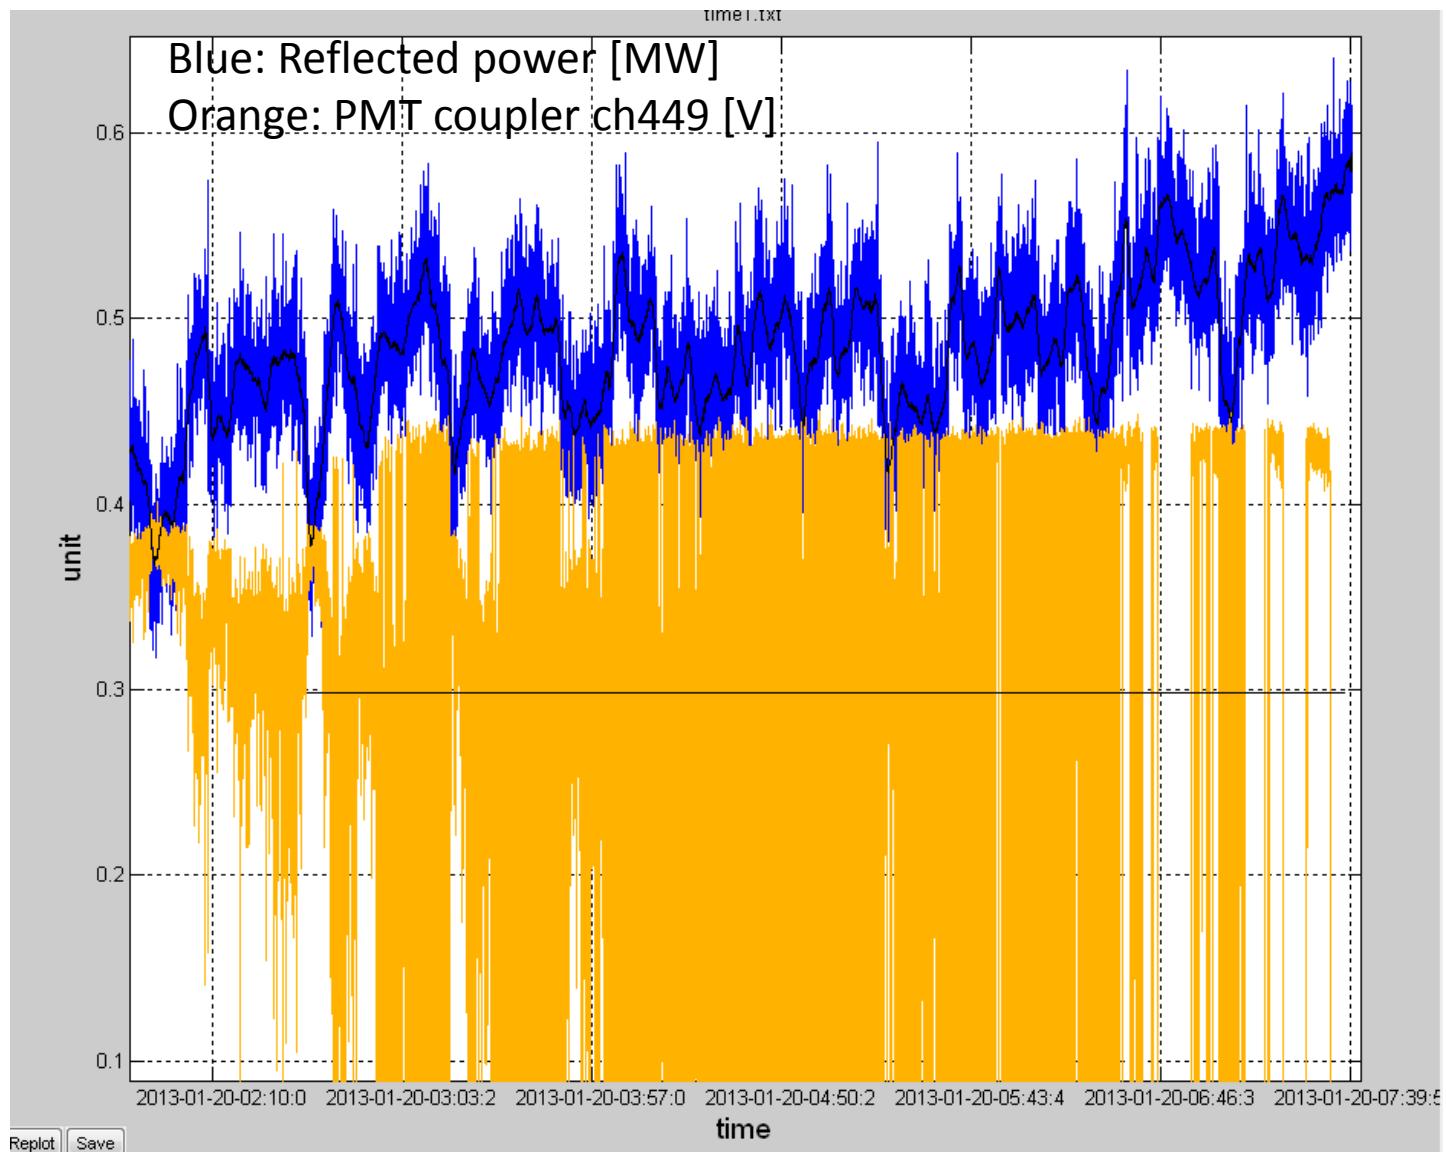

# History from GUI

No correlations between PMTs signals jumps and RF signals, DCM signal, PD\_gamma, Gun e-det coupler /window and Booster PMT in cell1 were found.

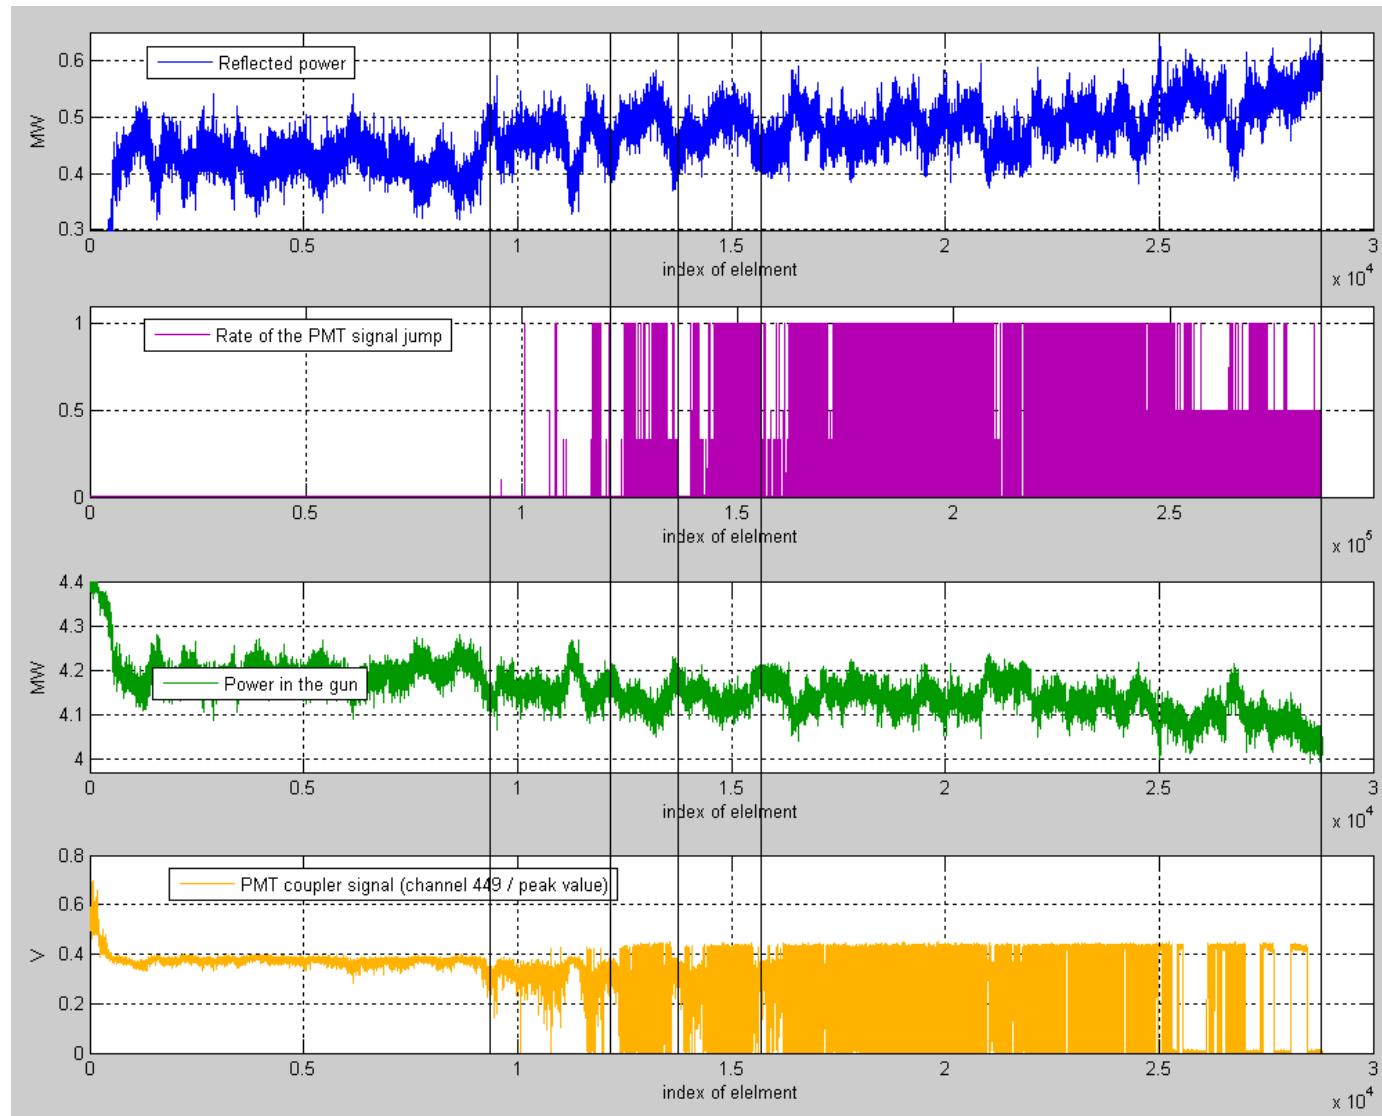

Some correlation between reflected power and PMT signal could be observed (see next slides).

Correlation of reflected power and signal of PMT coupler.  
Data has taken from DAQ

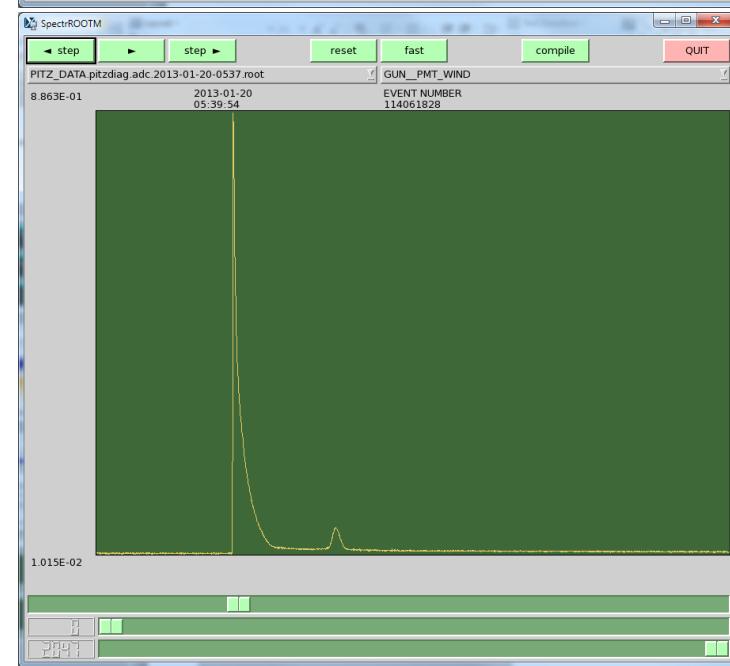

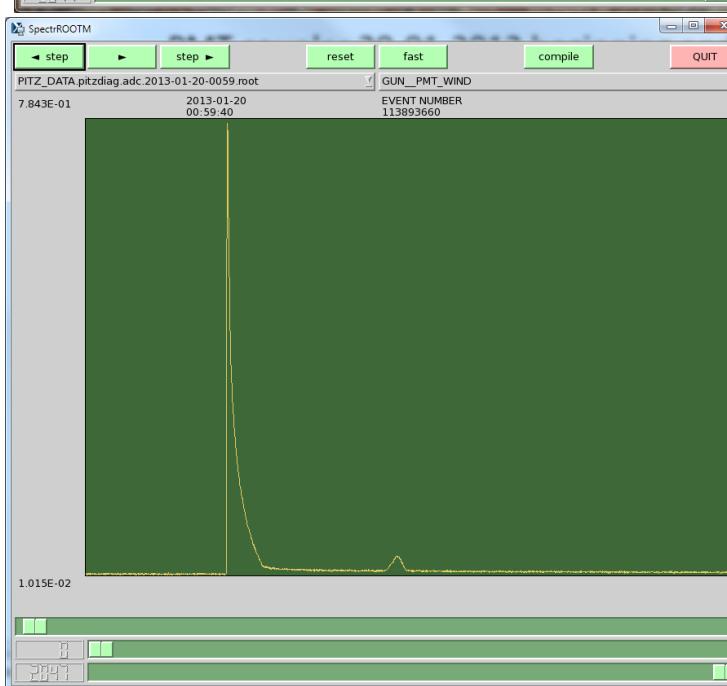

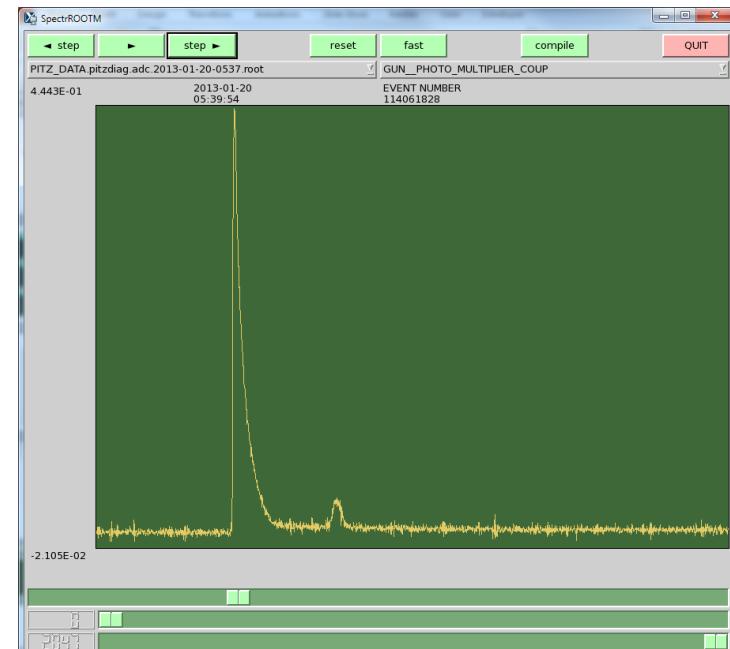

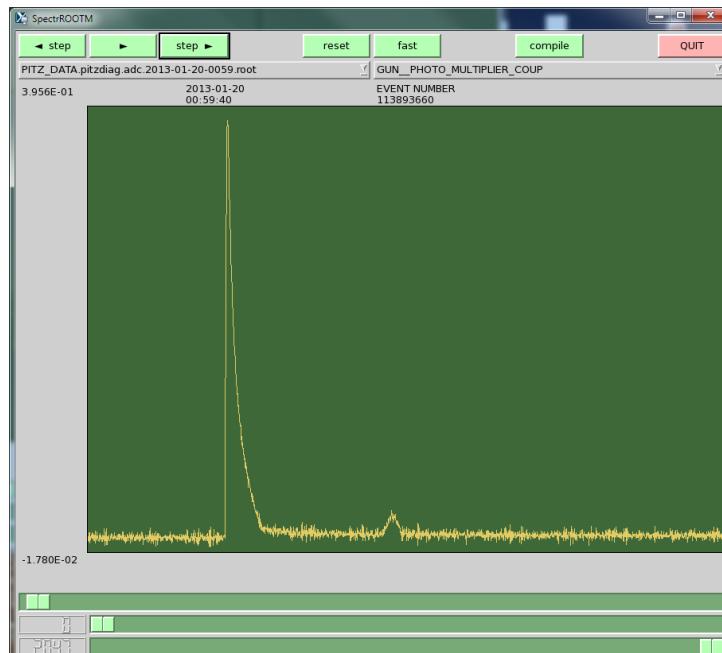

Correlation of power (in the cavity and reflected) and PMT coupler signal ch449 (peak value)  
Rate of the PMT signal jump means difference between current and previous jump of the PMT signal.

It looks that these jumps started when reflected power crossed some level of  $\sim 0.43$  MW

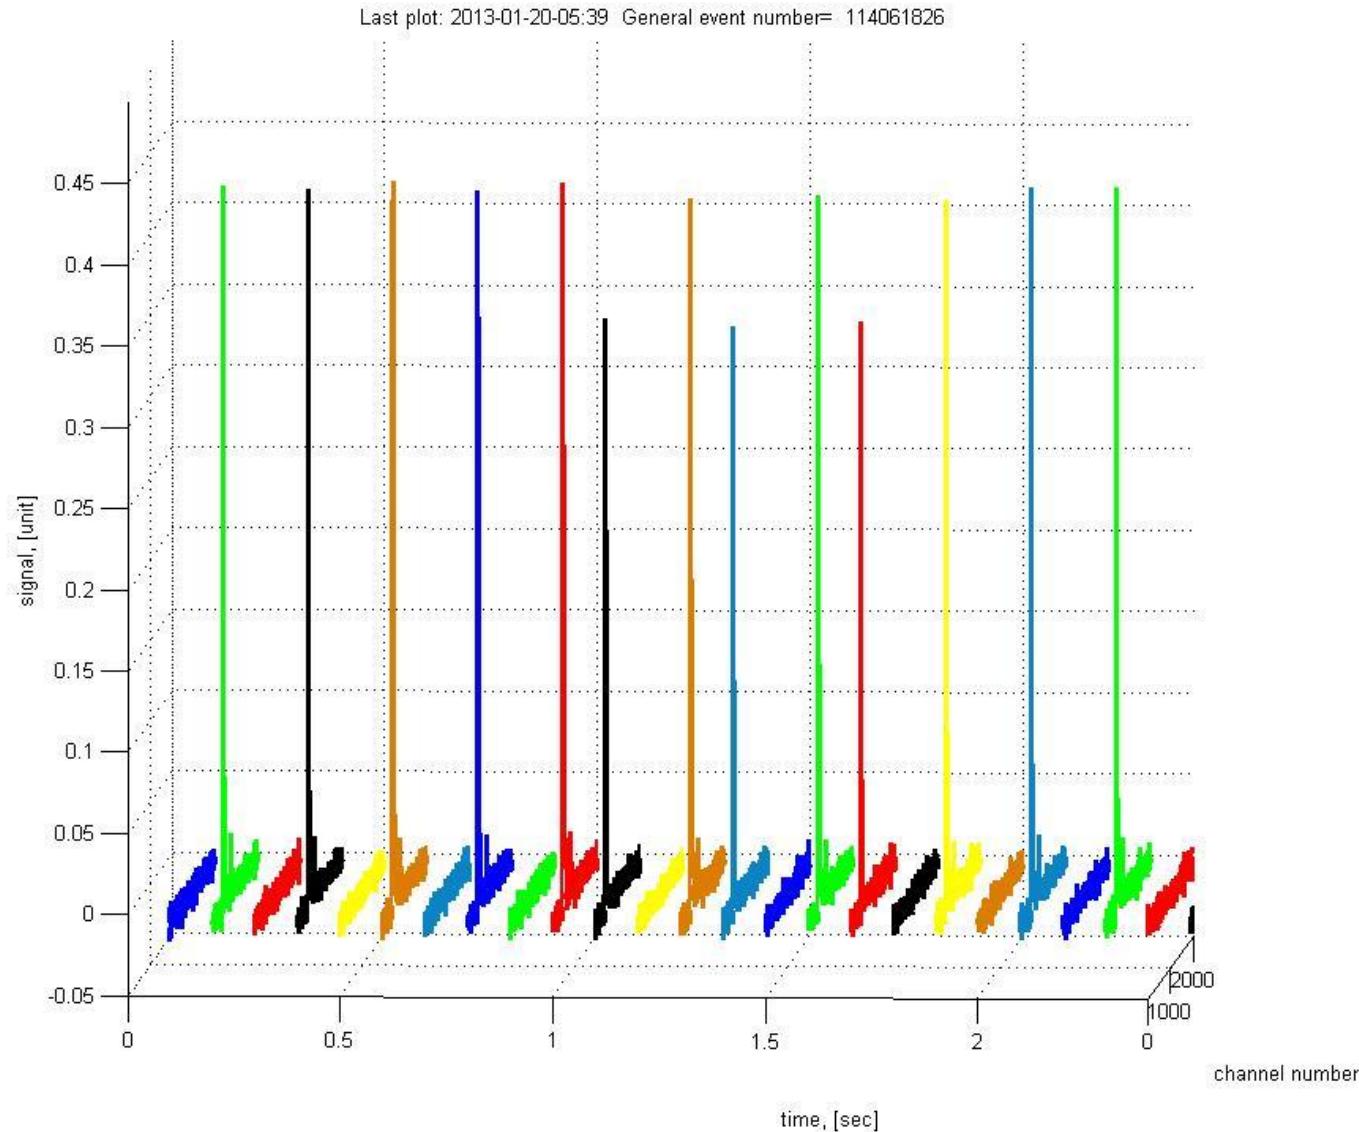

# PMT coupler 20-01-2013 beginning and end of 830us run

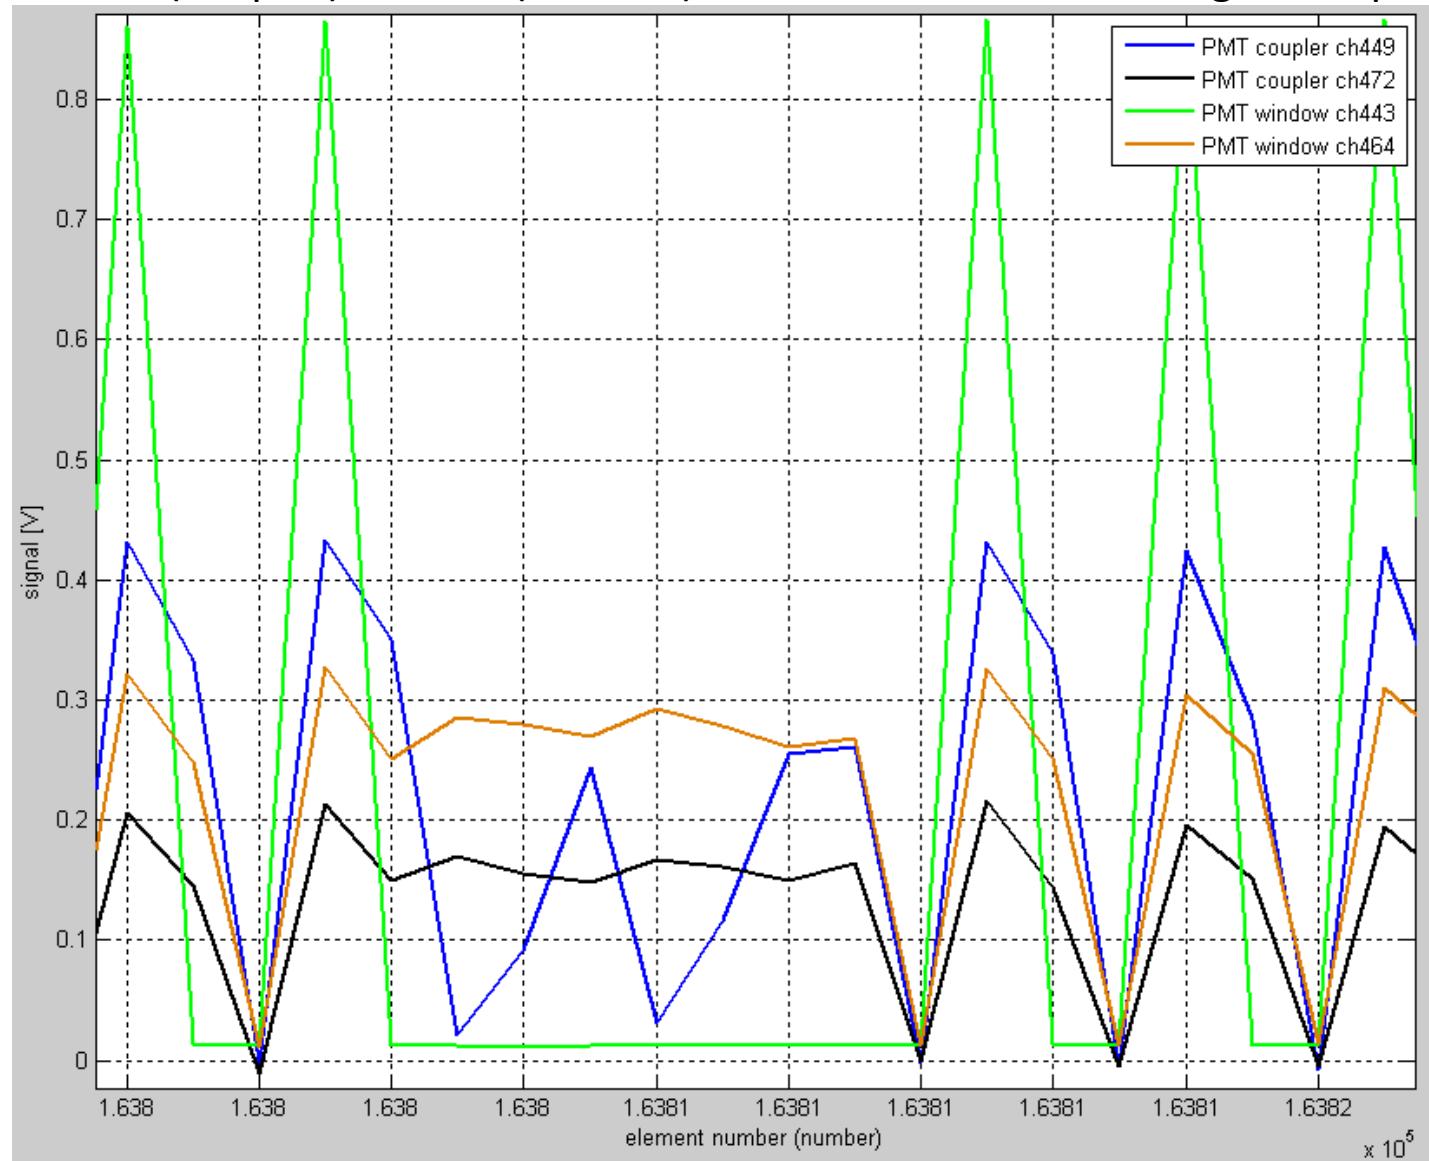

# PMT coupler signal in time

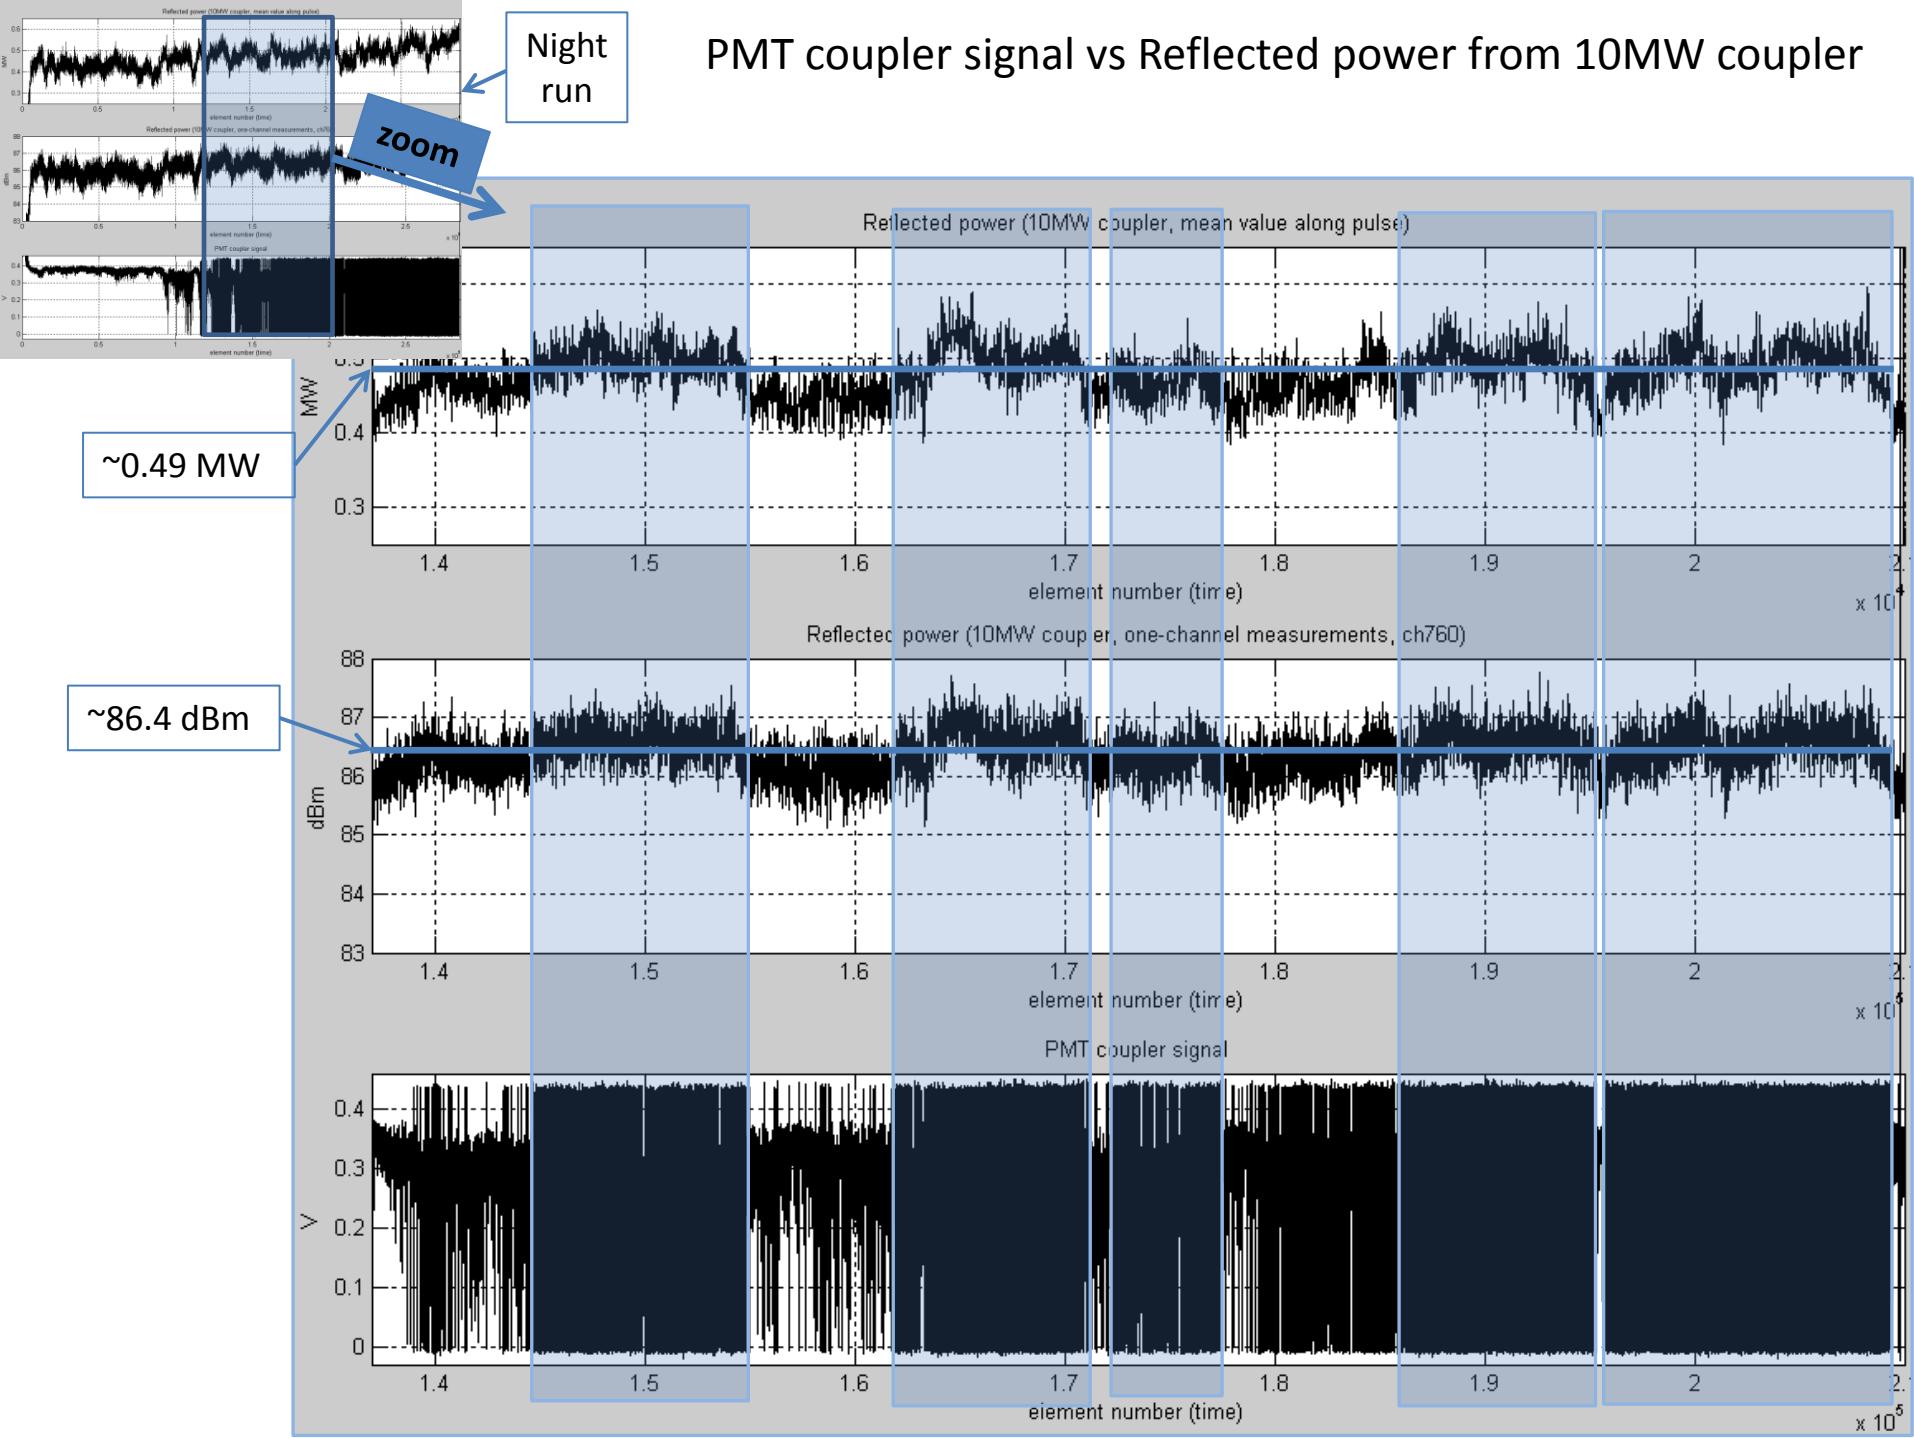

Not only each second event is zero level.

PMT coupler and window signals at the same time.  
Channels 449(coupler) and 443(window) are almost at the peak value, channels  
472(coupler) and 464(window) are at the middle of the signal shape

# PMT coupler signal vs Reflected power from 10MW coupler

PMT signal vs Reflected power
