

Techniques for longitudinal phase space measurements

Malyutin Dmitriy

Content

1. Dipole + Aerogel + Streak camera
(PITZ, DESY, Germany)
2. Deflection cavity + Dipole + screen + camera
(SPARC, INFN/LNF, Italy)

Dipole + aerogel layout

Dipole + aerogel

time resolution

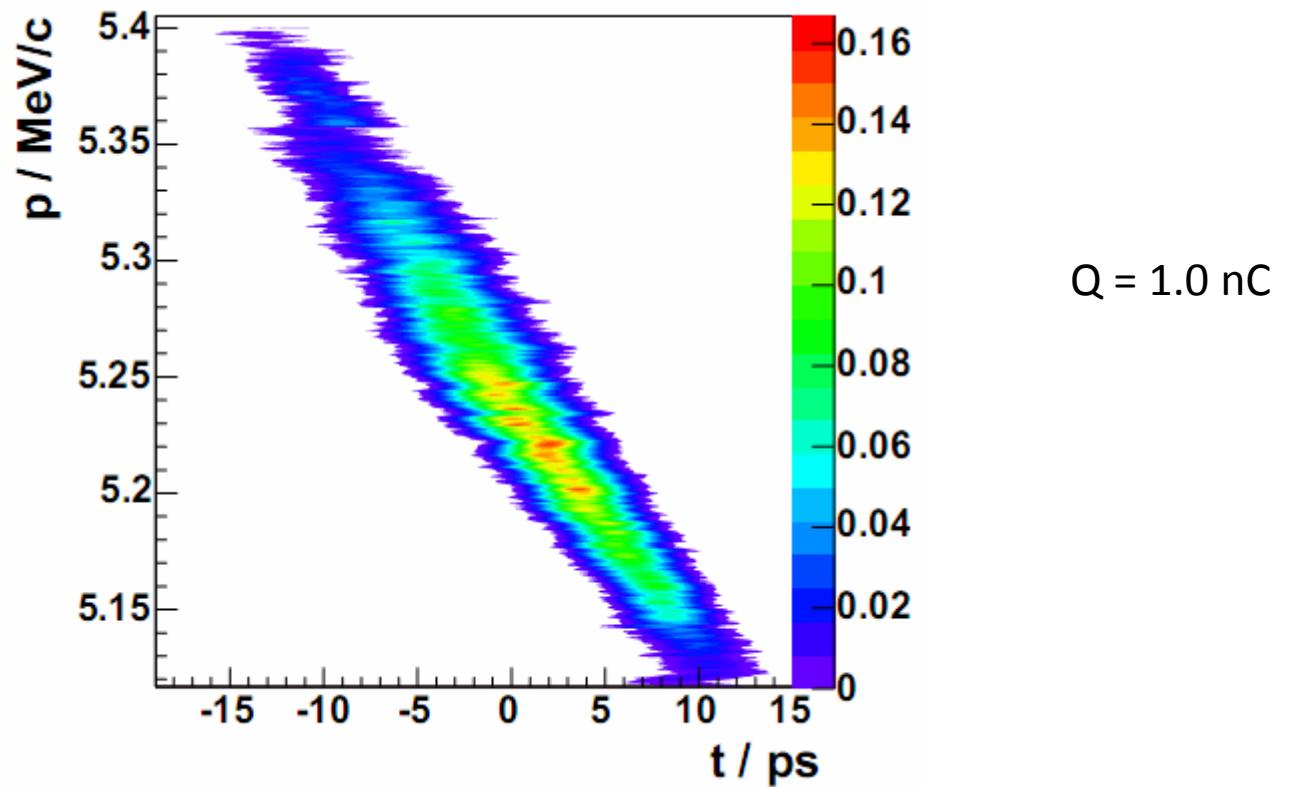

Aerogel time resolution – 0.22 ps (5 MeV)

Optical transmission line – 1 ps

Streak camera time resolution – 2 ps

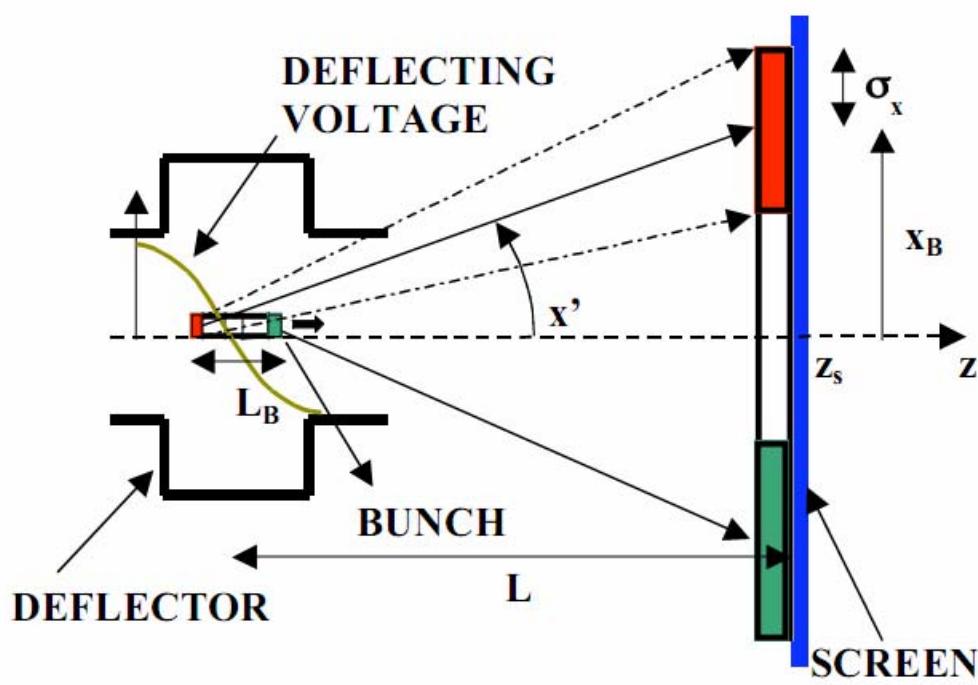

Total resolution – 3.2 ps

Dipole + aerogel experimental results (PITZ)

Deflection cavity basics

$$E, B \propto \sin(2\pi f_{RF} t)$$

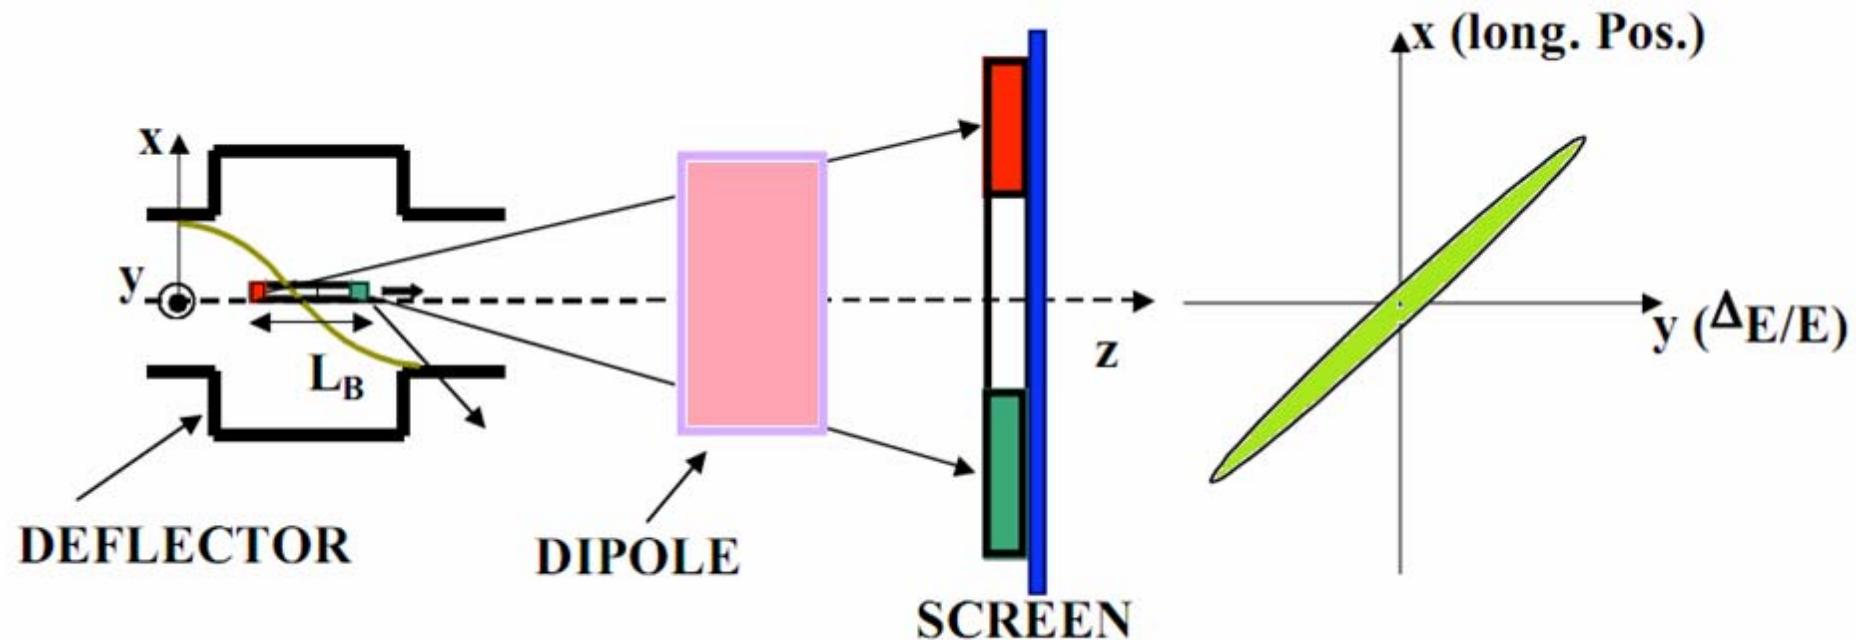

$$L_B \propto \frac{c}{f_{RF}}$$

$$x_B = \frac{\pi f_{RF} L L_B V_0}{c E / e}$$

$$L_{res} = \frac{\sigma_x c E / e}{\pi f_{RF} L V_0}$$

Deflection cavity

basics

Deflection cavity resolution

For following parameters:

$$f_{RF} = 1.3 \text{ GHz}$$

$$V_0 = 1 \text{ MV}$$

$$E = 20 \text{ MeV}$$

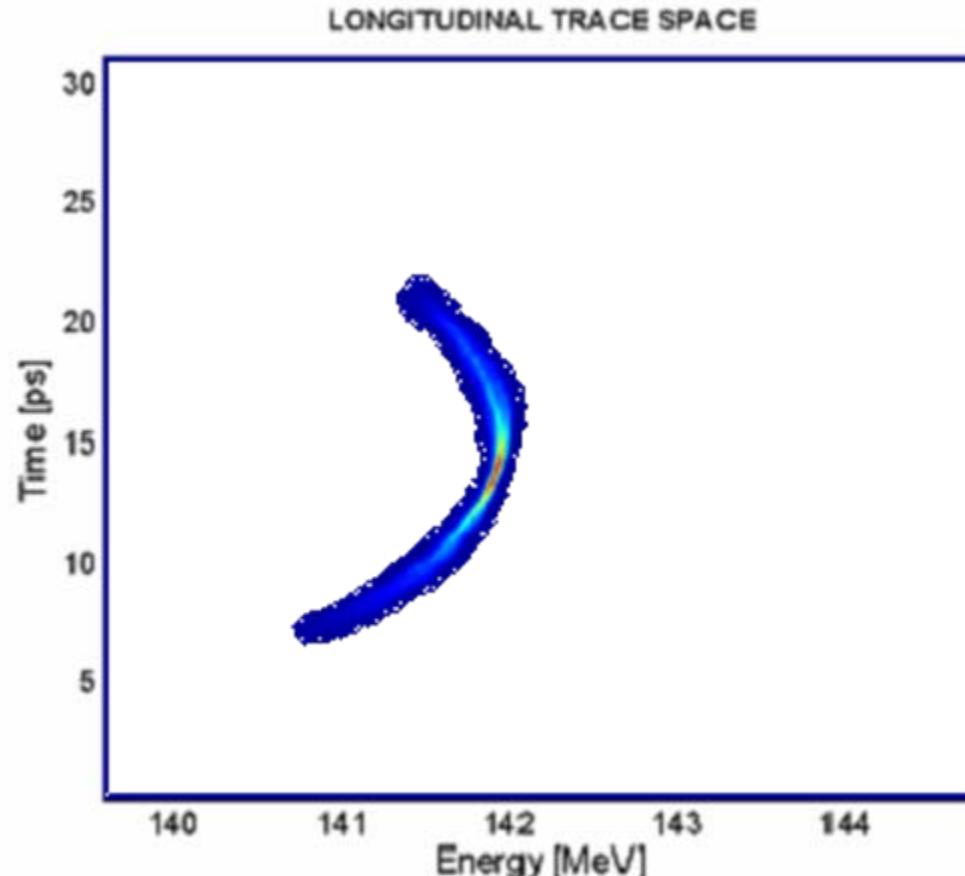

$$X_B = 4 \text{ mm}$$

$$\sigma x = 20 \text{ um}$$

$$L_{\text{res}} = 30 \text{ um (0.1 ps)}$$

$$L = 1 \text{ m}$$

Deflection cavity experimental results (SPARC)

Conclusion

	Aerogel	Deflection cavity
Time resolution	3.2 ps	0.1 ps
Energy resolution	0.5 %	0.5 %
Single bunch measurement	-	+
